Mini Program regards some object names in browser such as `window`, `document` as reserved names for future use. The reserved names include **globalThis**, **global**, **fetch**, **self**, **window**, **document**, **location**, **XMLHttpRequest**. Please do not use these names for module name, or the module can not be used normally. For example:

copy

```

import { window } from './myWindow'
console.log(window) // undefined

```

The above codes show that if using the reserved name as the module name, the imported module will be `undefined`. So you should not use these reserved names or rename the module name by using `as` when importing the module. For example:

copy

```

import { window as myWindow } from './myWindow'
console.log(myWindow)

```

Third-party NPM Module

The Mini Program supports introduction of the third-party module. It is required to firstly run the following command to install the module in the Mini Program root directory:

```
copy
$ npm install lodash --save
```

After the installation, it can be used directly in the logic layer:

```
copy
import lodash from 'lodash'; // Loading the third-party npm module
```

Note: Since the third-party module in the node_modules does not go through the converter, for the compatibility in various terminals, the codes in the node_modules should be converted into the es5 format before using. For the module format, it is recommended to use the import/export of es2015. Meanwhile, the browser related capabilities of the browser cannot be used either.

Overview {#overview}

Last updated: 2021-05-09

Path: miniprogram_gcash

Overview

2021-05-09 18:43

Similar to Page, the customized components consist of four parts: axml, js, json and acss.

There are two steps to create a customized component:

1. Declare the customized component in json. If it is dependent on other components, it is required to declare additionally the dependent customized components.

Sample code:

```
copy
{
  "component": true, // mandate, the value for customized component
  must be true
  "usingComponents": {
```

```

    "c1": ".../x/index"
} //Dependent component
}

```

Parameter details:

Parameter	Type	Required	Description
Boolean	Yes	Declare customized component.	usingComponents Object No Path of the customized component in the dependence declaration Absolute project path starts with “/”, and relative path starts with “./” or “..” The npm path does not start with “/”.

1. Use the Component function to register the customized component. See [Component constructor](#).

Component parameter description:

Parameter	Description	Document
onInit	Callback on creation	
Component lifecycle	deriveDataFromProps	Callback on creation and update
Component lifecycle	data	local status Same as Page (can be modified via setData and \$spliceData).
props	Attribute transferred from outside	Component method and external attribute-props
methods	Customized method	Component method and external attribute - methods

Sample code:

copy

```
// /components/customer/index.js
Component({
  mixins: [], // minxin easy reuse code
  data: { x: 1 }, // internal data of component
  props: { y: 1 }, // Can add default to attribute transferred from
  outside
  onInit() {}, // trigger on component creation, added in version
  2.0.0
  deriveDataFromProps(nextProps) {}, // trigger on component creation
  and before update, added in version 2.0.0
  didMount(){}, // Lifecycle function
  didUpdate(){},
  didUnmount(){},
  methods: { // customized method
    handleTap() {
      this.setData({ x: this.data.x + 1}); // Can use setData to
      change internal attribute
    },
  },
})

```

in addition, the customized component supports slot and can build flexible page structure. See [component template and style](#).

Sample code:

copy

```
<!-- // /components/customer/index.axml -->
<view>
  <view>x: {{x}}</view>
  <button onTap="handleTap">plusOne</button>
  <slot>
    <view>default slot & default value</view>
  </slot>
</view>
```

Last updated: 2022-07-05

Path: miniprogram_gcash

Overview

2022-07-05 23:31

Mini programs offer a set of OpenAPIs to achieve various capabilities, for example, the payment capability. You can use the POST method to send HTTPS requests and receive responses accordingly.

The following section mainly introduces the message structure and the end-to-end message transmission workflow.

Versioning

The current API version is v1. The version is specified in the URL. For example:

<https://{{host}}/miniprogram/api/v1/payments/pay>.

Message structure

Before you make any request, it is important to understand how OpenAPI works and how requests and responses are structured. This section presents general information (such as message structure, message fields, and message transmission) of online messages between your system and wallet backend.

Request structure

The following figure illustrates the request structure.

Figure 1. Request structure

Request URL

The request URL is: `https://host/api/restful_path`, which has the following structure:

- **host**: includes the host that is the standard domain name assigned by the wallet backend.
- **restful_path** : is the path to the interface, for example, `{version}/payments/pay`
- **version**: is the version of OpenAPIs, for example, v1 or v2.

An interface can be uniquely identified by `restful_path`. For example, the `/v1/payments/pay` is different from `/v2/payments/pay`.

Request method

POST method is used to make an HTTP request.

Request header

The request header mainly contains the following fields.

Note: Field names are case-insensitive.

```
|||||---|---|---|| Header | Required | Code sample || Signature | Yes | Signature:  
algorithm=RSA256, keyVersion=1, signature=**** || Content-Type | No |  
Content-Type: application/json; charset=UTF-8 || Client-Id | Yes | Client-Id:  
**** || Request-Time | Yes | Request-Time: 2019-04-04T12:08:56.253+05:30 |
```

Table. Request header

For details of each header field, see the following description.

Signature

Signature contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm**: Specify the digital signature algorithm that is used to generate the signature. The value is not case-sensitive. RSA256 and ECC224 are supported, and RSA256 is by default.
- **keyVersion**: Specify the key version that is used to generate or validate the signature. By default, the value is the latest version of the key associated with **Client-Id**.

- **signature:** Contain the signature value of the request. For details about how to generate a signature, see the [Generate a signature](#) section.

Example:

copy

```
Signature: algorithm=RSA256, keyVersion=1,  
signature=KEhXthj4bJ801Hqw8kaLvEKc0Rii8KsNUazw7kZgjxyGSPu0Z48058UVJUKkf  
rWiHPae8ZRPuBagh2H3qu7fxY5GxVDWayJUhUYkr9m%2F0W4UQVmXaQ9yn%2Fw2dCtzAwf  
pMk%2BfDDmRflA%2FAMJhQ71yeyhufIA2PCJV8%2FCM0a46303A0WhhH0YPJ9%2FI0UeLV  
bRFvcowQwt0lP1XkoPmSLGpBevDE8%2FQ9WnxjPNDfrHnKgV2fp0hpMKVXNM%2BrLHNyMv:  
2FFYDAwSd%2B6%2FE0Fo9UbdlKcmodJwjKlQoxZZIzmF8w%3D%3Dxxxx
```

Content-Type (Optional)

Content-Type indicates the media type of the body of the request, as defined by [RFC2616](#). In which, **charset** is used for generating/validating the signature.

For example:

copy

```
Content-Type: application/json; charset=UTF-8
```

Client-Id

Client-Id is used to identify a client and is associated with the keys that are used for the signature.

Also in Mini Program OAuth scenario, here the **Client-Id** is also the client ID of OAuth, which is filled in the Mini Program SAAS Platform as follow:

Request-Time

Specify the time when the request is sent, as defined by [ISO8601](#).

Note: This field must be accurate to milliseconds.

copy

```
Request-Time: 2019-04-04T12:08:56.253+05:30
```

Request body

The request body contains the detailed request information in JSON format. Fields enclosed in the request body vary depending on services. For more information, see the specific API specification document.

Response structure

The following figures illustrate the response structure:

Figure 2. Response structure

Response header

The response header carries the information about the response, mainly containing the following fields.

Note: Field names are case-insensitive.

```
|||||---|---|---|| Header | Required | Code sample || Signature | Yes | Signature:  
algorithm=RSA256, keyVersion=1, signature=**** || Content-Type | No |  
Content-Type: application/json; charset=UTF-8 || Client-Id | Yes | Client-Id:  
**** || Response-Time | Yes | Response-Time: 2019-04-04T12:08:56.253+05:30 |
```

Table. Response header

For details of each header field, see the following description.

Signature

Signature contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm:** Specifies the digital signature algorithm that is used to generate the signature. The value is not case-sensitive. RSA256 and ECC224 are supported, and RSA256 is by default.
- **keyVersion:** Specifies the key version that is used to generate or validate the signature. By default, the value is the latest version of the key associated with **Client-Id**.
- **signature:** Contains the signature value of the response.

Example:

copy

```
Signature: algorithm=RSA256, keyVersion=1,  
signature=KEhXthj4bxxxJ801Hqw8kaLvEKc0Rii8KsNUazw7kZgjxyGSPu0Z48058UVJl  
rWiHPae8ZRPuBagh2H3qu7fxY5GxVDWayJUhUYkr9m%2F0W4UQVmXaQ9yn%2Fw2dCtzAwI  
pMk%2BfDDmRflA%2FAMjhQ71yeyhufIA2PCJV8%2FCM0a46303A0WHhH0YPJ9%2FI0UeLVl  
bRFvcowQwt0lP1XkoPmSLGpBevxxxDE8%2FQ9WnxjPNDfrHnKgV2fp0hpMKVXNM%2BrLHN  
2FFYDAwSd%2B6%xxxx
```

Content-Type (Optional)

Content-Type indicates the media type of the body of the response, as defined by [RFC2616](#). In which, **charset** is used for generating/validating the signature. For example:

copy

Content-Type: application/json; charset=UTF-8

Client-Id

Client-Id is used to identify a client and is associated with the keys that are used for signature.

Response-Time

Specifies the time when the response is returned, as defined by [ISO8601](#).

Note: This field must be accurate to milliseconds.

copy

Response-Time: 2019-04-04T14:08:56.253+05:30

Response body

The response body contains the information responding to the client. Fields in this section vary depending on services. However, the **result** object, which indicates the result of an API call, is always contained.

When the result status (**resultStatus**) is failed, unknown, or accepted, the result code (**resultCode**) means an error code and the result message (**resultMessage**) means an error message, which is used for error handling. For more information about error codes, see the [Error codes](#) chapter.

||||| --- | --- | --- | --- || **Field** | **Data Type** | **Required** | **Description** || resultStatus |

String | No | Result status. Valid values are:

- S : Successful

- F : Failed

- U : Unknown

- A : Accepted, not yet succeeded, but can proceed with some actions. || resultCode | String | No | Result code.

Maximum length: 64 characters || resultMessage | String | No | Result message that describes the result code in detail.

Maximum length: 256 characters |

Message transmission workflow

The following figure is an example that illustrates the message transmission workflow in Mini Program.

Figure 1. Message transmission workflow

Overall procedure

Follow the overall procedure to call an API.

Preparations

To prevent some potential errors that you might get in the response, consider the following factors:

- Understand [API idempontency](#).

1. Construct a request

Construct a request by complying with the [request structure](#), including the request header and body.

To ensure message transmission security, perform the following security measures when constructing a request. For details, see the [Message transmission security](#) chapter.

1. Must [sign a request](#). Message signing and signature validation are mandatory for all requests and responses.
2. [Encode](#) a request to prevent errors or ambiguity that might be caused by special characters enclosed in a request. For more information, see the [Message encoding](#) chapter.

2. Send a request

You can send a request with your preferred platforms or tools, for example, Postman or cURL command.

3. Check the response

The response is usually returned in JSON or XML format. For details about the response, see the [response structure](#) section. After you receive the response, [validate the signature of the response](#).

4. Check the status code

The response data can vary depending on the services. However, the `result` field, which indicates the result of an API call, is always included. If an error occurs when you call an API, an error response is returned, where `the result object` indicates the error code and error message for you to troubleshoot issues. For more information, see the [Error code](#) chapter.

Overview {#overview}

Last updated: 2021-05-09

Path: miniprogram_gcash

Overview

2021-05-09 18:43

File Structure

The Mini Program is divided into two layers: `app` and `page`. The `app` describes the whole program; the `page` describes the individual pages.

The `app` consists of three files and must be placed in the root directory of the project.

File	Mandatory	Function
<code>app.js</code>	Yes	Mini Program logic.
<code>app.json</code>	Yes	Mini Program global configuration.
<code>app.acss</code>	No	Mini Program global style sheet.

The `page` consists of four file types:

File type	Mandatory	Function
<code>js</code>	Yes	Page logic.
<code>axml</code>	Yes	Page structure.
<code>acss</code>	No	Page style sheet.
<code>json</code>	No	Page configuration.

Note: For the convenience of developers, we specify these four files must have the same path and filename. All the codes written by the developer will eventually be packaged into a JavaScript script which runs when Mini Program start and is destroyed when Mini Program finish running.

Logic Structure

The core of Mini Program is a responsive data binding system, composed of the view layer and logic layer. The two layers keep always synchronous. Whenever the data is modified in logic layer, the view layer is updated accordingly.

See the following simple example.

copy

```
<!-- View layer -->
<view> Hello {{name}}! </view>
<button onTap="changeName"> Click me! </button>
```

copy

```
// Logic layer
var initData = {
  name: 'AppContainer'
};
// Register a Page.
Page({
  data: initData,
  changeName(e) {
    // sent data change to view
    this.setData({
      name: 'Mini Program'
    })
  }
});
```

In the above codes, the framework automatically binds the `name` in the logic layer to the `name` in the view layer, so whenever the page is opened, it displays `Hello AppContainer!`

When the user presses the button, the view layer sends the `changeName` event to the logic layer. The logic layer finds the corresponding event handler. The logic layer executes the `setData` operation, changing the `name` from `AppContainer` to `Mini Program`. Since the logic layer and view layer are already bound, the displaying of the view layer automatically changes to `Hello Mini Program!`.

Note: Since the framework does not work in the browser, some web capabilities of JavaScript cannot be used, such as the `document` and `window` objects.

For the logic layer js, the codes can be organized through the es2015 modular syntax:

copy

```
import util from './util'; // Loading relative path
import absolute from '/absolute'; // Loading project root directory
path
```

Reserved Names for Module

Mini Program regards some object names in browser such as `window`, `document` as reserved names for future use. The reserved names include **`globalThis`**, **`global`**, **`fetch`**, **`self`**, **`window`**, **`document`**, **`location`**, **`XMLHttpRequest`**. Please do not use these names for module name, or the module can not be used normally. For example:

copy

```
import { window } from './myWindow'
console.log(window) // undefined
```

The above codes show that if using the reserved name as the module name, the imported module will be `undefined`. So you should not use these reserved names or rename the module name by using `as` when importing the module. For example:

copy

```
import { window as myWindow } from './myWindow'
console.log(myWindow)
```

Third-party NPM Module

The Mini Program supports introduction of the third-party module. It is required to firstly run the following command to install the module in the Mini Program root directory:

copy

```
$ npm install lodash --save
```

After the installation, it can be used directly in the logic layer:

copy

```
import lodash from 'lodash'; // Loading the third-party npm module
```

Note: Since the third-party module in the `node_modules` does not go through the converter, for the compatibility in various terminals, the codes in the `node_modules` should be converted into the `es5` format before using. For the module format, it is recommended to use the `import/export` of `es2015`. Meanwhile, the browser related capabilities of the browser cannot be used either.

Overview {#overview}

Last updated: 2021-05-09

Path: miniprogram_gcash

Overview

2021-05-09 18:43

Mini Programs offers a set of OpenAPIs to achieve various capabilities, for example, the payment capability. You can use POST method to send HTTPS requests and receive response accordingly.

Message structure

Before you make any request, it is important to understand how OpenAPI works and how requests and responses are structured. This section presents general information (such as message structure, message fields, and message transmission) of online message between your system and wallet backend.

Request structure

The following figure illustrates the request structure.

Figure 1. Request structure

Request URL

The request URL is: `https://host/api/restful_path`

where,

- **host:** includes the host that is the standard domain name assigned by the wallet backend.
- **restful_path :** is the path to the interface, for example, `/version/payments/pay`
- **version:** is the version of OpenAPIs, for example, v1 or v2.

An interface can be uniquely identified by `restful_path`. For example, the `/v1/payments/pay` is different from `/v2/payments/pay`.

Request method

POST method is used to make an HTTP request.

Request header

The request header mainly contains the following fields.

Tip: Field names are case-insensitive.

```
||||| --- | --- | --- || Header field | Required | Code sample || Signature | Yes |
Signature: algorithm=RSA256, keyVersion=1, signature=**** || Encrypt | No
(It is used only when data includes sensitive information) | Encrypt:
algorithm=RSA_AES, keyVersion=1, symmetricKey=**** || Content-Type | No |
Content-Type: application/json; charset=UTF-8 || Client-Id | Yes | Client-Id:
**** || Request-Time | Yes | Request-Time: 2019-04-04T12:08:56.253+05:30 |
```

Table. Request header

For details of each header field, see the following description.

Signature

Signature contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm:** Specifies the digital signature algorithm that is used to generate the signature. The value is not case-sensitive. RSA256 and ECC224 are supported, and RSA256 by default.
- **keyVersion:** Specifies the key version that is used to generate or validate the signature. By default, the value is the latest version of the key associated with **Client-Id**.
- **signature:** Contains the signature value of the request. For details about how to generate a signature, see the [Generate a signature](#) section.

Example:

copy

```
Signature: algorithm=RSA256, keyVersion=1,
signature=KEhXthj4bJ801Hqw8kaLvEKc0Rii8KsNUazw7kZgjxyGSPu0Z48058UVJUkkI
rWiHPae8ZRPuBagh2H3qu7fxY5GxVDWayJUhUYkr9m%2F0W4UQVmXaQ9yn%2Fw2dCtzAwI
pMk%2BfDDmRflA%2FAMJh071yeyhufIA2PCJV8%2FCM0a46303A0WHhH0YPJ9%2FI0UeLVI
bRFvcowQwt0lP1XkoPmSLGpBevDE8%2FQ9WnxjPNDfrHnKgV2fp0hpMKVXNM%2BrLHNyMv:
2FFYDAwSd%2B6%2FE0Fo9UbdlKcmoJwjKlQoxZZIzmF8w%3D%3Dxxxx
```

Encrypt

This field is required when a message need to be encrypted, especially when sensitive information is included in the message. **Encrypt** contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm:** Specifies the symmetric key algorithm that is used to encrypt message. The value is not case-sensitive, and currently only RSA_AES is supported.
- **keyVersion:** Specifies the symmetric key version that is used to encrypt message. By default, the value is the latest version of the key associated with clientId.
- **symmetricKey:** Contains the encrypted symmetric key.

For example:

copy

```
Encrypt: algorithm=RSA_AES, keyVersion=1,  
symmetricKey=bqS8HSmdaRrpKSuPy7CqUlyd8lJurG93xxxx
```

Content-Type

Optional. **Content-Type** indicates the media type of the body of the request, as defined by [RFC2616](#). In which, **charset** is used for generating/validating signature and encrypting/decrypting content.

For example:

copy

```
Content-Type: application/json; charset=UTF-8
```

Client-Id

Client-Id is used to identify a client, and is associated with the keys that are used for signature and encryption.

Also in Mini Program OAuth scenario, here the**Client-Id** is also the client id of OAuth, which is filled in Mini Program SAAS platform as follow:

Request-Time

Specifies the time when the request is sent, as defined by [RFC3339](#). Note: This field must be accurate to milliseconds.

copy

```
Request-Time: 2019-04-04T12:08:56.253+05:30
```

Request body

The request body contains the detailed request information in a JSON format. Fields enclosed in the request body vary depending on services. For more information, see the specific API specification.

Response structure

The following figures illustrate the response structure:

Figure 2. Response structure

Response header

The response header carries the information about the response, mainly containing the following fields.

Tip: Field names are case-insensitive.

```
||||| --- | --- | --- || Header field | Required | Code sample || Signature | Yes |
Signature: algorithm=RSA256, keyVersion=1, signature=**** || Encrypt | No
(It is used only when data includes sensitive information) | Encrypt:
algorithm=RSA_AES, keyVersion=1, symmetricKey=**** || Content-Type | No |
Content-Type: application/json; charset=UTF-8 || traceId | No | traceId:
0be9923**** || Client-Id | Yes | Client-Id: **** || Response-Time | Yes | Response-
Time: 2019-04-04T12:08:56.253+05:30 |
```

Table. Response header

For details of each header field, see the following description.

Signature

Signature contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm:** Specifies the digital signature algorithm that is used to generate the signature. The value is not case-sensitive. RSA256 and ECC224 are supported, and RSA256 by default.
- **keyVersion:** Specifies the key version that is used to generate or validate the signature. By default, the value is the latest version of the key associated with **Client-Id**.
- **signature:** Contains the signature value of the response.

Example:

copy

```
Signature: algorithm=RSA256, keyVersion=1,
signature=KEhXthj4bxxxJ801Hqw8kaLvEKc0Rii8KsNUazw7kZgjxyGSPu0Z48058UVJl
rWiHPae8ZRPuBagh2H3qu7fxY5GxVDWayJUhUYkr9m%2F0W4UQVmXaQ9yn%2Fw2dCtzwAWt
pMk%2BfDDmRflA%2FAMJh071yeyhufIA2PCJV8%2FCM0a46303A0WHhH0YPJ9%2FI0UeLVI
bRFvcowQwt0lP1XkoPmSLGpBevxxxDE8%2FQ9WnxjPNDfrHnKgV2fp0hpMKVXNM%2BrLHNj
2FFYDAwSd%2B6%xxxx
```

Encrypt

This field is required when a response needs to be encrypted. **Encrypt** contains key-value pairs that are separated by comma (,). Each key-value pair is an equation, which is a key joined with its value with an equal sign (=).

The following keys can be configured:

- **algorithm:** Specifies the symmetric key algorithm that is used to encrypt a message. The value is not case-sensitive, and currently only RSA_AES is supported.
- **keyVersion:** Specifies the symmetric key version that is used to encrypt a message. By default, the value is the latest version of the key associated with clientId.
- **symmetricKey:** Contains the encrypted symmetric key.

For example:

copy

Encrypt: algorithm=RSA_AES, keyVersion=1,
symmetricKey=bqS8HSmdaRrpKSuPy7Cqulyd8lJUrG93xxxx

Content-Type

Optional. **Content-Type** indicates the media type of the body of the response, as defined by [RFC2616](#). In which, **charset** is used for generating/validating the signature and encrypting/decrypting content.

For example:

copy

Content-Type: application/json; charset=UTF-8

traceId

The **traceId** field is used for troubleshooting when there is something wrong with a request processing. For example, use **traceId** to identify the specific request that has issues.

Client-Id

Client-Id is used to identify a client, and is associated with the keys that are used for signature and encryption.

Response-Time****

Specifies the time when the response is returned, as defined by [RFC3339](#). Note: This field must be accurate to milliseconds.

copy

Response-Time: 2019-04-04T14:08:56.253+05:30

Response body

Response body contains the information responding to the client. Fields in this section vary depending on services. However, the `result` object, which indicates the result of an API call, is always contained.

When the result status (`resultStatus`) is failed, unknown, or accepted, the result code (`resultCode`) means an error code and the result message (`resultMessage`) means an error message, which is used for error handling. For more information about error codes, see the Error codes chapter.

Field	Data type	Required	Description	resultStatus
-------	-----------	----------	-------------	--------------

String | No | Result status. Valid values are:

- S : Successful
 - F : Failed
 - U : Unknown
 - A : accepted, not yet succeed, but can proceed with some actions. || resultCode | String | No | Result code.

Max. length: 64 characters || resultMessage | String | No | Result message that describes the result code in details.

Max. length: 256 characters |

Message transmission workflow

The following figure is an example that illustrates the message transmission workflow in Mini Program.

Figure 1. Message transmission workflow

Overall procedure

Follow the overall procedure to call an API.

Preparations

To prevent some potential errors that you might get in the response, consider the following factors:

- Understand [API idempontency](#)

1. Construct a request

Construct a request by complying with [the request structure](#), including the request header and body.

To ensure the message transmission security, perform the following security measures when constructing a request. For details, see the [Message transmission security](#) chapter.

1. Encrypt a request when the data includes sensitive information or it is required by clients. If encryption is required, the message body should be encrypted before it is signed.
2. Must [sign a request](#). Message signing and signature validation is mandatory for all requests and responses.
3. [Encode](#) a request to prevent errors or ambiguity that might be caused by special characters enclosed in a request. For more information, see the [Message encoding](#) chapter.

2. Send a request

You can send a request for example via Postman or cURL command.

3. Check the response

The response is returned usually in JSON or XML format. For details about the response, see the [Response structure](#) section.

After you receive the response, perform the following actions:

1. [Validate the signature of the response](#).
2. Decrypt the response if the request is encrypted.

4. Check the status code

If an error occurs when you call an API, an error response is returned, where [the result object](#) indicates the error code and error message for you to troubleshoot issues.

Last updated: 2022-07-03

Path: miniprogram_gcash

Overview

2022-07-03 18:44

Basic Component

The Mini Program provides the developers with a series of basic components so that the developers can combine them for service development.

Attribute Type

The component provides a series of attribute configuration. Each attribute value has the requirement for type:

```
||||| --- | --- | --- || Type | Description | Notes || Boolean | Boolean ||| Number | Number
||| String | String ||| Array | Array ||| Object | Object ||| EventHandle | Event handler |
Need to define the implementation for the event handler in Page
. || any | Any type ||
```

Common Component Attribute

All components include the following attributes:

||||| --- | --- | --- | --- | --- | **Property** | **Type** | **Description** | **Notes** || id | String | Unique component identifier. || class | String | Style class. || style | String | Inline style. || data-* | Any | Custom attributes. | When the event is triggered, the custom attribute is transferred to the event handler. || on *catch* | EventHandle | Event binding, following theump nomenclature specifications, such as onTap. | Refer to [event](#). |

Tips

The {{}} is required to transfer inside the specified attribute type data. For example

copy

```
<view disable-scroll="false"> <!-- Error is a string, not a boolean,
equivalent to boolean type true -->
<view disable-scroll="{{false}}> <!--right, or empty attribute,
meaning false-->
```

Overview

2021-05-09 18:43

API

The framework provides the developers with more JSAPI and OpenAPI capabilities so that they can launch diversified convenient services to the users.

Notes:

The APIs started with my.on are used to listen to the system events and accept one callback function as the parameter. When the event is triggered, it calls the callback function, which will transfer to the related API started with my.off to cancel the listening

relation. If the API started with my.off is called directly, all listening relations will be canceled. Example

copy

```
Page({
  onLoad() {
    this.callback = this.callback.bind(this);
    my.onBLECharacteristicValueChange(this.callback);
  },
  onUnload() {
    // remove listener when page unload
    my.offBLECharacteristicValueChange(this.callback);
  },
  callback(res) {
    console.log(res);
  },
});
```

All other API interfaces accept one object as the parameter. It is possible to specify success (call success), fail (call failure) and complete (call success or failure) cto receive the interface call result. The callback result is generally an object unless otherwise specified. If an error/errorMessage is included, it indicates call failure. The result value after the call is a promise object. Example

copy

```
my.httpRequest({
  url: '/x.htm',
  success(res1) {},
}).then((res2) => {
  // res1 === res2
},(res) => {
  console.log(res.error, res.errorMessage);
})
```

Overview

2022-07-05 23:31

Introduction

Mini Program extended component library provides important additional capabilities on the basic component library basis. The extended component library contains a set of open-source UI components, which are developed on the basis of Mini Program custom component specifications. Mini Program developers can reuse the extended components rapidly.

Installation

Use the following sample code to install the dependency:

copy

```
$ npm install mini-ali-ui --save
```

Procedures

To use the component, complete the following steps:

1. Register the component in JSON file of the related page. For example, the title component registration is as below:

copy

```
{  
  "usingComponents": {  
    "title": "mini-ali-ui/es/title/index"  
  }  
}
```

If you install the rpx version of the extended component library, modify the component name during registration:

copy

```
{  
  "usingComponents": {  
    "title": "mini-ali-ui-rpx/es/title/index"  
  }  
}
```

2. Call the component in the AXML file.

copy

```
<title  
hasLine="true"  
iconURL="https://example.com/images/T1HHFgXXVeXXXXXXXXX.png"  
type="close"  
onActionTap="titleClose"  
>the internal title can be closed  
</title>
```

Version upgrade

Upgrade UI component version by using the following command:

copy

```
$ npm update mini-ali-ui --save
```

Note:

The latest version is 1.3.0.

Overview {#overview}

Last updated: 2022-07-03

Path: miniprogram_gcash

Overview

2022-07-03 18:44

Similar to Page, the customized components consist of four parts: axml, js, json and acss.

There are two steps to create a customized component:

1. Declare the customized component in json. If it is dependent on other components, it is required to declare additionally the dependent customized components.

Sample code:

```
copy

{
  "component": true, // mandate, the value for customized component must be true
  "usingComponents": {
    "c1": "../x/index"
  } //Dependent component
}
```

Parameter details:

Parameter	Type	Required	Description
component	Boolean	Yes	Declare customized component.
usingComponents	Object	No	Path of the customized component in the dependence declaration Absolute project path starts with “/”, and relative path starts with “./” or “..” The npm path does not start with “/”.

1. Use the Component function to register the customized component. See [Component constructor](#).

Component parameter description:

Parameter	Description	Document
onInit	Callback on creation	Component lifecycle .
deriveDataFromProps	Callback on creation and update	Component lifecycle .
data	local status	Same as Page (can be modified via setData and \$spliceData).
props	Attribute transferred from outside	Component method and external attribute-props .
methods	Customized method	Component method and external attribute - methods .

Sample code:

```
copy

// /components/customer/index.js
Component({
  mixins: [], // minxin easy reuse code
  data: { x: 1 }, // internal data of component
  props: { y: 1 }, // Can add default to attribute transferred from outside
  onInit() {}, // trigger on component creation, added in version 2.0.0
  deriveDataFromProps(nextProps) {}, // trigger on component creation and before update, added in version 2.0.0
  didMount(){}, // Lifecycle function
  didUpdate(){},
  didUnmount(){},
  methods: { // customized method
    handleTap() {
      this.setData({ x: this.data.x + 1}); // Can use setData to
```

```
change internal attribute
  },
  },
})
```

in addition, the customized component supports slot and can build flexible page structure. See [component template and style](#) .

Sample code:

copy

```
<!-- // /components/customer/index.axml -->
<view>
  <view>x: {{x}}</view>
  <button onTap="handleTap">plusOne</button>
  <slot>
    <view>default slot & default value</view>
  </slot>
</view>
```

API

The framework provides the developers with more JSAPI and OpenAPI capabilities so that they can launch diversified convenient services to the users.

Notes:

The APIs started with my.on are used to listen to the system events and accept one callback function as the parameter. When the event is triggered, it calls the callback function, which will transfer to the related API started with my.off to cancel the listening relation. If the API started with my.off is called directly, all listening relations will be canceled. Example

copy

```
Page({
  onLoad() {
    this.callback = this.callback.bind(this);
    my.onBLECharacteristicValueChange(this.callback);
  },
  onUnload() {
    // remove listener when page unload
    my.offBLECharacteristicValueChange(this.callback);
  },
  callback(res) {
    console.log(res);
  },
});
```

All other API interfaces accept one object as the parameter. It is possible to specify success (call success), fail (call failure) and complete (call success or failure) cto receive the interface call result. The callback result is generally an object unless otherwise specified. If an error/errorMessage is included, it indicates call failure. The result value after the call is a promise object. Example

copy

```
my.httpRequest({
  url: '/x.htm',
  success(res1) {},
}).then((res2) => {
  // res1 === res2
},(res) => {
  console.log(res.error, res.errorMessage);
})
```

Page Configuration {#page-configuration}

Last updated: 2022-07-03

Path: miniprogram_gcash

Page Configuration

2022-07-03 18:44

In the directory /pages, the .json file is used to configure the window display of the current page. The page configuration is much simpler than the app.json global configuration. It is possible to set the window related configuration items only but it is not

necessary to write the window key. The page configurations are prior to global configurations.

The window configurations are the same as [Global Configuration](#) and support the following points additionally:

- Supporting the optionMenu configuration navigation icon, which triggers onOptionMenuItemClick on clicking. However, please note that the optionMenu configuration will be deprecated.
- Supporting titlePenetrate to set the navigation bar click-through
- Supporting barButtonTheme to set the navigation bar icon scheme

Complete configurations

Property	Type	Required	Description	Minimum version
optionMenu	Object	NO	Set extra icon of navigation bar, supporting attribute icon with value as icon URL (starting with https/http) or base64 string, suggested size 30*30 px.	1.3.0
titlePenetrate	BOOL	NO	Set navigation bar click-through.	-
barButtonTheme	String	NO	Set navigation bar icon scheme, “default” for blue icon or “light” for white icon.	-

Here is a basic example:

```
copy
{
  "optionMenu": {
    "icon": "https://img.example.com/example.png"
  },
  "titlePenetrate": "YES",
  "barButtonTheme": "light"
}
```

Page FAQ

2021-05-09 18:43

Q: How to use cookie in Mini Program

A: Cookie is not suggested to be used in Mini Program, the cookie set by server side will not be forbidden and it will be set to the Mini Program process. In the next request, the cookie will be set into the request automatically. In front side, cookie can not be obtained and will do nothing about the cookie.

Q: How to get the parameters of onload in certain page

A: From `getCurrentPages`, the instance of page stack can be obtained, then parameters can be obtained.

Q: Can Mini Program able to listen to the close event? Which function will be invoked when clicking the close button?

A: Mini Program can not listen to the close event and nothing will be invoked when clicking the close button.

Q: Data does not refresh when calling setData

A: Please check the effectiveness of `this` instance and make sure the code logic is correct.

Q: Blank page displays when jumping to a new page, how to solve it

A: If using `request` to get data from server side, please make sure the domain whitelist is configured. If not, the data can not be requested, which may causing blank page.

Q: How to get the parameter in the link when jumping to a new page

A: Use `onLaunch` to listen to the initialization of Mini Program, the query can be obtained from the `onLaunch` parameter.

Q: How to import js in Mini Program

A: Use `import {Ajax} from '/util(or ./util)'` to import js

Q: How to trigger a function automatically without clicking

A: Call the function in `onload` or `onshow`.

Page Introduction {#page-introduction}

Last updated: 2021-05-09

Path: miniprogram_gcash

Page Introduction

2021-05-09 18:43

Page represents a page of Mini Program, taking charge of the display and interaction of page. Each page will have a subdirectory in the project, basically there are as many subdirectories as there are pages. It is also a constructor to generate instance of page.

Each page consists of four files:

- `[PageName].js`: page logic
- `[PageName].axml`: page structure
- `[PageName].json`: page configuration (optional)
- `[PageName].acss`: page style sheet (optional)

When page is initialized, the data should be provided.

copy

```
Page({
  data: {
    title: 'Mini Program',
    array: [{user: 'li'}, {user: 'zha'}],
  },
});
```

According to the data provided, the page can be rendered.

copy

```
<view>{{title}}</view>
<view>{{array[0].user}}</view>
```

The function should be specified when defining interaction.

copy

```
<view onTap="handleTap">click me</view>
```

The above code shows when user clicks the view, the `handleTap` function will be invoked.

copy

```
Page({
  handleTap() {
    console.log('yo! view tap!');
  },
});
```

If you want to re-render the page, you need to call `this.setData` function in the `[PageName].js` script.

copy

```
<view>{{text}}</view>
<button onTap="changeText"> Change normal data </button>
```

The above code shows when user click the view, the `changeText` function will be invoked.

copy

```
Page({
  data: {
    text: 'init data',
  },
  changeText() {
    this.setData({
      text: 'changed data',
    });
  },
});
```

In the `changeText` function, `this.setData` is called to change the text data, and then the page will re-render to show the changed data.

Page Mechanism {#page-mechanism}

Last updated: 2022-06-30

Path: miniprogram_gcash

Page Mechanism

2022-06-30 23:35

Page(object: Object)

Each .js file in the /pages directory has a `Page` object to define properties for a Mini Program page. We can use this object to specify the initial data, register lifecycle callbacks, and customize event handlers.

Below are the basic page codes:

copy

```
// pages/index/index.js
Page({
  data: {
    title: "Mini Program",
  },
  onLoad(query) {
    // Page loading
  },
  onShow() {
```

```

    // Page showing
},
onReady() {
    // Page loading complete
},
onHide() {
    // Page hiding
},
onUnload() {
    // Page closed
},
onTitleClick() {
    // Title clicked
},
onPullDownRefresh() {
    // Page pulled down
},
onReachBottom() {
    // Page pulled down till bottom
},
onShareAppMessage() {
    // Return customized sharing information
},
// Event handler object
events: {
    onBack() {
        console.log('onBack');
    },
},
// Custom event handler
viewTap() {
    this.setData({
        text: 'Set data for update.',
    });
},
// Custom event handler
go() {
    // Jump with parameters, read type from query of onLoad function
    // in page/ui/index
    my.navigateTo({url: '/page/ui/index?type=mini'});
},
// Custom data object
customData: {
    name: 'Mini Program',
},
);
}

```

Page Lifecycle

The diagram below shows the lifecycle of the Page object.

The Mini Program basically uses the view thread (Webview) and application service thread (Worker) for control and management. The Webview and Worker threads run in parallel.

- Upon startup, the Worker thread invokes `app.onLaunch` and `app.onShow` when the app is created. Subsequently when WebView initialization completes, the Worker thread receives a notification from WebView thread and then invokes `page onLoad` and `page.onShow` to indicate the completion of page creation.
- Upon the notification on completion of the Webview initialization, the Worker sends the initialized data to the Webview for render. Now the Webview completes the first data render.
- After the first render is completed, the Webview enters into the ready status and notifies the Worker. The Worker calls the `page.onReady` function and enters into the active status.
- in the active status, the Worker modifies data each time and then notifies the Webview for rendering. When switched to the background, the Worker calls the `page onHide` function and enters into the suspended status. The `page.onShow` function will be called when page returns to the foreground and enters into the active status. When the return or redirection page is called, the function `page.onUnload` is called for page destroying.

Object Attribute Description

		Property	Type	Description	Minimum version		
Object	Function	Function for initializing data or returning initialized data.	Object	events	-	1.13.7	

Object | Function | Function for initializing data or returning initialized data. | - | events | Object | Event handler object. | 1.13.7 | `onLoad` | Function(query: Object) | Trigger on page loading. | - | `onShow` | Function | Trigger on page showing. | - | `onReady` | Function | Trigger on completion of initial page rendering. | - | `onHide` | Function | Trigger on page hiding. | - | `onUnload` | Function | Trigger on page unloading. | - | `onShareAppMessage` | Function(options: Object) | Trigger on clicking upper-right corner share. | - | `onTitleClick` | Function | Trigger on clicking title. | - | `onOptionMenuClick` | Function | Trigger on clicking extra icon of navigation bar. | 1.3.0 | `onPopupMenuClick` | Function | Trigger on clicking custom menu buttons in upper-right general menu. | 1.3.0 | `onPullDownRefresh` | Function({from: manual | code}) | Trigger on pulling down page. | - | `onPullIntercept` | Function | Trigger on pulling down interruption. | 1.11.0 | `onTabItemTap` | Function | Trigger on clicking tabItem. | 1.11.0 | `onPageScroll` | Function({scrollTop}) | Trigger on page scrolling. | - | `onReachBottom` | Function | Trigger on pulling page till bottom. | - | Others | Any | The developer can add any function or attribute column into the object. The this can be used for access in the page functions. | - |

Page Data Object

The initial data can be specified for the page by setting data. When data is an object, it is shared by all pages. In other words, when it returns and then enters the page again, the last page data will be displayed instead of the initial data. In such a case, the issue may be fixed by setting data as unchanged data or changing data as page exclusive data.

Set as unchanged data

copy

```
Page({
  data: { arr: [] },
  doIt() {
    this.setData({arr: [...this.data.arr, 1]}),
  },
});
```

Set as page exclusive data (not recommended)**copy**

```
Page({
  data() { return { arr: [] }; },
  doIt() {
    this.setData({arr: [1, 2, 3]}),
  },
});
```

Notes:

Do not modify `this.data` directly, which will not change the page status and will cause data inconsistency.

For example:

copy

```
Page({
  data: { arr: [] },
  doIt() {
    this.data.arr.push(1); // Do not do this!
    this.setData({arr: this.data.arr});
  }
});
```

Lifecycle Function

onLoad(query: Object)

Trigger on page initializing. It called only once for each page.

The query is the query object transferred in the `my.navigateTo` and `my.redirectTo`.

The query content is in the format: "parameter name=parameter value¶meter name=parameter value..."

||||| --- | --- | --- || **Property | Type | Description** || query | Object | Parameter for opening the current page path. |

onShow()

Trigger on page showing or switching to foreground

onReady()

Trigger on completion of initial page rendering. It is called only once for each page, indicating the page is ready and can interact with view layer. For the setting of interface such as `my.setNavigationBar`, please set behind `onReady`.

onHide()

Trigger on page hiding or switching to background. Such as `my.navigateTo` to another page or switching via bottom tab.

onUnload()

Trigger on page unloading. Such as `my.redirectTo` or `my.navigateBack` to another page.

Page Event Handler

onShareAppMessage(options: Object)

Trigger on clicking the **Share** button in upper-right general menu or clicking in-page **Share** button.

Define the `onShareAppMessage` function in Page and set the sharing information:

- Display the **Share** button in the upper-right menu of every page by default. Only the shared content can be customized by using the `onShareAppMessage` function.
- The `onShareAppMessage` function is called when the user clicks the **Share** button.
- This event handler must return an Object to customize the shared content.
- The mini program supports to trigger the sharing by using the button component. The value of open-type is `share`.

Sample codes:

copy

```
// API-DEMO page/API/share/share.json
{
    "defaultTitle" : "onShareAppMessage"
}
```

copy

```
<view class = "page" >
<view class = "page-description" > Click the upper-right menu to
```

```

customize the sharing </view>
</view>

copy

// API-DEMO page/API/share/share.js
Page ({
  onShareAppMessage () {
    return {
      title : 'Sharing the View component' ,
      desc : 'The View component is general' ,
      path : 'page/component/view/view' ,
      };
    },
  });

```

Sample codes for triggering the sharing with the button component:

copy

```

<view>
<button type="primary" open-type="share" a:if="
{{canIUseShareButton}}">Share to friends</button>
</view>

```

copy

```

Page({
  data: { canIUseShareButton: true },
  setShareButtonSwitch () { this.setData({ canIUseShareButton:
my.canIUse('button.open-type.share') }) },
  onLoad() { this.setShareButtonSwitch(); } ,

  onShareAppMessage() {
    return {
      title: 'Mini program demo',
      desc: 'Mini program official demo that displays the supported
APIs and components',
      path: 'page/component/component-pages/view/view?param=123'
    }
  }
});

```

The parameters are in Object type and have the following attributes:

Property	Type	Description
from	String	Source of triggering sharing event. Valid values are:
- button	click the button in the page to trigger the sharing;	
- menu	click the button in the upper-right menu to trigger the sharing;	
- code	call the <u>my.showSharePanel</u> API to trigger the sharing.	
target	Object	If the value of from is button, target is the button that triggers the event. Otherwise, button is undefined.
webViewUrl	String	When the page contains the web-view component, return the URL of the current web-view.

This event handler must return an Object to customize the shared content.

Return value

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | Yes |
Customized sharing title. Max 50 characters. || desc | String | No | Customized
description about the sharing. The maximum length is 140 characters when sharing to
Sina Weibo, so it's suggested that the description does not exceed 140 characters. || path |
String | Yes | Customized sharing path. The customized parameters in the path can be
obtained from the onLoad lifecycle function and follow the HTTP GET rules. The path
cannot contain the root directory (/). || imageUrl | String | No | The path of the
customized icon, which can be a web image path. Recommended Image size is 1200 x
630 pixels and should not be more than 8M, and Minimum image size is 200 x 200
pixels. || bgImgUrl | String | No | The path of the customized image, which can be a web
image path. The image size is suggested to be 750 x 825 pixels. || success | Function | No
| The callback method that indicates a successful sharing. || fail | Function | No | The
callback method that indicates a failed sharing. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || channelName | String | The sharing
channel. || shareResult | Boolean | The result that indicates whether the sharing is
successful. |

onTitleClick()

Trigger on clicking title.

onOptionMenuClick()

Trigger on clicking upper-right corner menu button.

onPopMenuItemClick()

Trigger on clicking upper-right corner general menu button.

onPullDownRefresh({from: manual | code})

Trigger on pulling down to refresh. It is required to enable pullRefresh in the window
option of [app.json](#). When the data refresh is processed completely, call
`my.stopPullDownRefresh` to stop the pull-to-refresh for that page.

onPullIntercept()

Trigger on pulling down interruption.

onTabItemTap(object: Object)

Trigger on clicking tabItem

Property	Type	Description
from	String	Click source.
pagePath	String	Page path of the clicked tabItem.
text	String	Button text of the clicked tabItem.
index	Number	Number of the clicked tabItem, starting from 0.

onPageScroll({scrollTop})

Trigger on page scrolling, scrollTop is the page scrolling distance.

onReachBottom()

Trigger on pulling page till bottom.

Events

To simplify codes, a new event handler object events is available. The existing page handler is equivalent to the exposed event functions on the page instance.

Notes:

- The support for events starts from basic library version 1.13.7.
- Please distinguish the basic library version requirements for the same named functions of the page event handler and events.

Below is the list of event functions supported by events:

Event	Type	Description	Lowest version
onBack	Function	Trigger on page returning.	1.13.7
onKeyboardHeight	Function	Trigger on keyboard height changing.	1.13.7
onOptionMenuClick	Function	Trigger on clicking upper-right corner menu button.	1.13.7
onPopupMenuClick	Function	Trigger on clicking upper-right corner general menu button.	1.13.7
onPullIntercept	Function	Trigger on pulling down interruption.	1.13.7
onPullDownRefresh	Function	Trigger on pulling down page.	1.13.7
onTitleClick	Function	Trigger on clicking title.	1.13.7
onTabItemTap	Function	Trigger on click non-current tabItem.	1.13.7
beforeTabItemTap	Function	Trigger before click non-current tabItem.	1.13.7
onResize	Function	Trigger on window size changing.	{size: {windowWidth: number, windowHeight: number}}
			1.16.0

Sample code:

copy

```
// Feature detection
my.canIUse('page.events.onBack');
```

```
Page({
  data: {
    text: 'This is page data.'
  },
  onLoad(){
    // trigger on page loading
  },
});
```

```
events:{  
    onBack(){  
        // Trigger on page returning  
    },  
    onKeyboardHeight(e){  
        // Trigger on keyboard height changing  
        console.log('keyboard height:', e.height)  
    },  
    onOptionMenuClick(){  
        // Trigger on clicking upper-right corner menu button  
    },  
    onPopMenuItemClick(e){  
        // Trigger on clicking custom menu buttons in upper-right  
        general menu  
        console.log('index of the clicked custom menu', e.index)  
        console.log('name of the clicked custom menu', e.name)  
        console.log('menuIconUrl of the clicked custom menu',  
e.menuIconUrl)  
    },  
    onPullIntercept(){  
        // Trigger on pulling down interruption  
    },  
    onPullDownRefresh(e){  
        // Trigger on pulling down page The e.from value "code"  
        indicates the event triggered by startPullDownRefresh; value "manual"  
        indicates the pull-down event trigger by user  
        console.log('type of triggered pull-down refresh', e.from)  
        my.stopPullDownRefresh()  
    },  
    onTitleClick(){  
        // Trigger on clicking title  
    },  
    onTabItemTap(e){  
        // e.from means triggering after clicking tabItem and switching;  
        value "user" indicates event triggered by user clicking; value "api"  
        indicates event triggered by switchTab  
        console.log('type of triggering tab change', e.from)  
        console.log('path of page corresponding to the clicked tab',  
e.pagePath)  
        console.log('text of the clicked tab', e.text)  
        console.log('index of the clicked tab', e.index)  
    },  
    beforeTabItemTap(){  
        // trigger on clicking tabItem but before switching  
    },  
    onResize(e){  
        // Trigger on window size changing  
        var {windowWidth, windowHeight} = e.size  
        console.log('width of changed window', windowWidth)  
        console.log('height of changed window', windowHeight)  
    },
```

```

    }
})

```

Page.prototype.setData(data: Object, callback: Function)

The `setData` sends data from logic layer to view layer and changes the value of `this.data`.

The `Object` is expressed in the form `key: Value`. The key value in `this.data` is changed to `value`. Here, the key can be flexibly provided in form of data path, such as `array[2].message`, `a.b.c.d`. It is not necessary to predefine in `this.data`.

The following points are worth attentions in use:

1. It is invalid to modify `this.data` directly, which will not change the page status and will cause data inconsistency.
2. Only the JSON supported data is supported.
3. Try not to set too many data once.
4. Do not set any value in the data as undefined, otherwise, that item will not be set, and potential issue may arise.

Sample code:

copy

```

<view>{{text}}</view>
<button onTap="changeTitle"> Change normal data </button>
<view>{{array[0].text}}</view>
<button onTap="changeArray"> Change Array data </button>
<view>{{object.text}}</view>
<button onTap="changePlanetColor"> Change Object data </button>
<view>{{newField.text}}</view>
<button onTap="addNewKey"> Add new data </button>
<view>hello: {{name}}</view>
<button onTap="changeName"> Change name </button>

```

copy

```

Page({
  data: {
    text: 'test',
    array: [{text: 'a'}],
    object: {
      text: 'blue',
    },
    name: 'Mini Program',
  },
  changeTitle() {

```

```

// Wrong! Do not modify the data directly
// this.data.text = 'changed data'

// Correct!
this.setData({
  text: 'ha',
});
},
changeArray() {
  // Possible to modify data by using directly data path
  this.setData({
    'array[0].text': 'b',
  });
},
changePlanetColor(){
  this.setData({
    'object.text': 'red',
  });
},
addNewKey() {
  this.setData({
    'newField.text': 'c',
  });
},
changeName() {
  this.setData({
    name: 'Mini Program',
  }, () => { // Accept transfer of callback function
    console.log(this); // this: current page instance
    this.setData({ name: this.data.name + ', ' + 'welcome!' });
  });
},
);
}
);

```

Parameter description:

Event	Type	Description	Lowest version	data	Object
Data to be changed.	callback	Function	Callback function, to be executed on completion of page rendering and update.	1.7.0, Use <code>my.canIUse('page.setData.callback')</code>	for compatibility processing.

Page.prototype.\$spliceData(data: Object, callback: Function)

Note: `$spliceData` is supported since version 1.7.2. The `my.canIUse('page.$spliceData')` can be used for compatibility processing.

Similarly, the `spliceData` is used to transfer data from logic layer to view layer, but has higher performance than `setData` in processing long list.

The `Object` is expressed in the form `key: Value..` The `key` value in `this.data` is changed to `value`. Here, the key can be flexibly provided in form of data path, such as `array[2].message`, `a.b.c.d`. It is not necessary to predefine in `this.data`. The `value` is an array (format: `[start, deleteCount, ...items]`). The first element of the array is the start position of the operation, the second element is the number of elements to be deleted, and other other elements are the insertion data. It maps the array `splice` method in es5.

Sample code:

copy

```
<!-- pages/index/index.axml -->
<view class="spliceData">
    <view a:for="{{a.b}}" key="{{item}}" style="border:1px solid red">
        {{item}}
    </view>
</view>
```

copy

```
// pages/index/index.js
Page({
    data: {
        a: {
            b: [1,2,3,4],
        },
    },
    onLoad(){
        this.$spliceData({ 'a.b': [1, 0, 5, 6] });
    },
});
```

Page output:

copy

```
1
5
6
2
3
4
```

Parameter description:

--- --- ---	Event	Type	Description	data Object Data to be changed.
callback Function	Callback function, to be executed on completion of page rendering and update.			

Page.prototype.\$batchedUpdates(callback: Function)

Batch update data.

Note: \$batchedUpdates is supported since version 1.14.0.

Them.y.canIUse('page.\$batchedUpdates') can be used for compatibility processing.

Parameter description:

--- --- ---	Event	Type	Description
callback	Function	The data operation in the callback function will be updated in batch.	

Sample code:

copy

```
// pages/index/index.js
Page({
  data: {
    counter: 0,
  },
  plus() {
    setTimeout(() => {
      this.$batchedUpdates(() => {
        this.setData({
          counter: this.data.counter + 1,
        });
        this.setData({
          counter: this.data.counter + 1,
        });
      });
    }, 200);
  },
});
```

copy

```
<!-- pages/index/index.axml -->
<view>{{counter}}</view>
<button onTap="plus">+2</button>
```

1. In this example, page counter adds 2 on each button clicking.

2. The `setData` is placed within `this.$batchedUpdates`. Thus, only one data transfer happens despite of multiple `setData`.

Page.route

Path of Page, mapping the path value configured in app.json, type `String`

This is a read-only attribute.

copy

```
Page({
  onShow() {
    // Map the path value configured in app.json
    console.log(this.route)
  }
})
```

Page Mechanism

2022-07-03 18:44

Page(object: Object)

Each .js file in the /pages directory has a Page object to define properties for a Mini Program page. We can use this object to specify the initial data, register lifecycle callbacks, and customize event handlers.

Below are the basic page codes:

copy

```
// pages/index/index.js
Page({
  data: {
    title: "Mini Program",
  },
  onLoad(query) {
    // Page loading
  },
  onShow() {
    // Page showing
  },
  onReady() {
    // Page loading complete
  }
})
```

```
},
onHide() {
    // Page hiding
},
onUnload() {
    // Page closed
},
onTitleClick() {
    // Title clicked
},
onPullDownRefresh() {
    // Page pulled down
},
onReachBottom() {
    // Page pulled down till bottom
},
onShareAppMessage() {
    // Return customized sharing information
},
// Event handler object
events: {
    onBack() {
        console.log('onBack');
    },
},
// Custom event handler
viewTap() {
    this.setData({
        text: 'Set data for update.',
    });
},
// Custom event handler
go() {
    // Jump with parameters, read type from query of onLoad function
    // in page/ui/index
    my.navigateTo({url: '/page/ui/index?type=mini'});
},
// Custom data object
customData: {
    name: 'Mini Program',
},
});
```

Page Lifecycle

The diagram below shows the lifecycle of the Page object.

The Mini Program basically uses the view thread (Webview) and application service thread (Worker) for control and management. The Webview and Worker threads run in parallel.

- Upon startup, the Worker thread invokes `app.onLaunch` and `app.onShow` when the app is created. Subsequently when WebView initialization completes, the Worker thread receives a notification from WebView thread and then invokes `page.onLoad` and `page.onShow` to indicate the completion of page creation.
- Upon the notification on completion of the Webview initialization, the Worker sends the initialized data to the Webview for render. Now the Webview completes the first data render.
- After the first render is completed, the Webview enters into the ready status and notifies the Worker. The Worker calls the `page.onReady` function and enters into the active status.
- in the active status, the Worker modifies data each time and then notifies the Webview for rendering. When switched to the background, the Worker calls the `page.onHide` function and enters into the suspended status. The `page.onShow` function will be called when page returns to the foreground and enters into the active status. When the return or redirection page is called, the function `page.onUnload` is called for page destroying.

Object Attribute Description

Property	Type	Description	Minimum version
Object	Function	Function for initializing data or returning initialized data.	-
Object	Event handler object.	1.13.7	<code>onLoad</code>
Object	Function	Trigger on page loading.	1.13.7
Object	Function	Trigger on page showing.	1.13.7
Object	Function	Trigger on completion of initial page rendering.	1.13.7
Object	Function	Trigger on page hiding.	1.13.7
Object	Function	Trigger on page unloading.	1.13.7
Object	Function	Trigger on clicking upper-right corner share.	1.13.7
Object	Function	Trigger on clicking title.	1.13.7
Object	Function	Trigger on clicking extra icon of navigation bar.	1.3.0
Object	Function	Trigger on clicking custom menu buttons in upper-right general menu.	1.3.0
Object	Function	Trigger on pulling down page.	-
Object	Function	Trigger on pulling down interruption.	1.11.0
Object	Function	Trigger on clicking tabItem.	1.11.0
Object	Function	Trigger on page scrolling.	1.11.0
Object	Function	Trigger on pulling page till bottom.	1.11.0
Others	Any	The developer can add any function or attribute column into the object. The <code>this</code> can be used for access in the page functions.	-

Page Data Object

The initial data can be specified for the page by setting data. When data is an object, it is shared by all pages. In other words, when it returns and then enters the page again, the last page data will be displayed instead of the initial data. In such a case, the issue may be fixed by setting data as unchanged data or changing data as page exclusive data.

Set as unchanged data

copy

```
Page({
  data: { arr: [] },
  doIt() {
    this.setData({arr: [...this.data.arr, 1]}),
  },
});
```

Set as page exclusive data (not recommended)

copy

```
Page({
  data() { return { arr: [] }; },
  doIt() {
    this.setData({arr: [1, 2, 3]});
  },
});
```

Notes:

Do not modify `this.data` directly, which will not change the page status and will cause data inconsistency.

For example:

copy

```
Page({
  data: { arr: [] },
  doIt() {
    this.data.arr.push(1); // Do not do this!
    this.setData({arr: this.data.arr});
  }
});
```

Lifecycle Function

onLoad(query: Object)

Trigger on page initializing. It called only once for each page.

The query is the query object transferred in the `my.navigateTo` and `my.redirectTo`.

The query content is in the format: "parameter name=parameter value¶meter name=parameter value..."

||||| --- | --- | --- || **Property | Type | Description** || query | Object | Parameter for opening the current page path. |

onShow()

Trigger on page showing or switching to foreground

onReady()

Trigger on completion of initial page rendering. It is called only once for each page, indicating the page is ready and can interact with view layer. For the setting of interface such as `my.setNavigationBar`, please set behind `onReady`.

onHide()

Trigger on page hiding or switching to background. Such as `my.navigateTo` to another page or switching via bottom tab.

onUnload()

Trigger on page unloading. Such as `my.redirectTo` or `my.navigateBack` to another page.

Page Event Handler

onShareAppMessage(options: Object)

Trigger on clicking the **Share** button in upper-right general menu or clicking in-page **Share** button.

Define the `onShareAppMessage` function in Page and set the sharing information:

- Display the **Share** button in the upper-right menu of every page by default. Only the shared content can be customized by using the `onShareAppMessage` function.
- The `onShareAppMessage` function is called when the user clicks the **Share** button.
- This event handler must return an Object to customize the shared content.
- The mini program supports to trigger the sharing by using the button component. The value of open-type is `share`.

Sample codes:

copy

```
// API-DEMO page/API/share/share.json
{
    "defaultTitle" : "onShareAppMessage"
}
```

copy

```
<view class = "page" >
<view class = "page-description" > Click the upper-right menu to
```

```

customize the sharing </view>
</view>

copy

// API-DEMO page/API/share/share.js
Page ({
  onShareAppMessage () {
    return {
      title : 'Sharing the View component' ,
      desc : 'The View component is general' ,
      path : 'page/component/view/view' ,
      };
    },
  });

```

Sample codes for triggering the sharing with the button component:

copy

```

<view>
<button type="primary" open-type="share" a:if="
{{canIUseShareButton}}">Share to friends</button>
</view>

```

copy

```

Page({
  data: { canIUseShareButton: true },
  setShareButtonSwitch () { this.setData({ canIUseShareButton:
my.canIUse('button.open-type.share') }) },
  onLoad() { this.setShareButtonSwitch(); } ,

  onShareAppMessage() {
    return {
      title: 'Mini program demo',
      desc: 'Mini program official demo that displays the supported
APIs and components',
      path: 'page/component/component-pages/view/view?param=123'
    }
  }
});

```

The parameters are in Object type and have the following attributes:

Property	Type	Description
from	String	Source of triggering sharing event. Valid values are:
- button	click the button in the page to trigger the sharing;	
- menu	click the button in the upper-right menu to trigger the sharing;	
- code	call the <u>my.showSharePanel</u> API to trigger the sharing.	
target	Object	If the value of from is button, target is the button that triggers the event. Otherwise, button is undefined.
webViewUrl	String	When the page contains the web-view component, return the URL of the current web-view.

This event handler must return an Object to customize the shared content.

Return value

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | Yes |
 Customized sharing title. Max 50 characters. || desc | String | No | Customized
 description about the sharing. The maximum length is 140 characters when sharing to
 Sina Weibo, so it's suggested that the description does not exceed 140 characters. || path |
 String | Yes | Customized sharing path. The customized parameters in the path can be
 obtained from the onLoad lifecycle function and follow the HTTP GET rules. The path
 cannot contain the root directory (/). || imageUrl | String | No | The path of the
 customized icon, which can be a web image path.
 Recommended Image size is 1200 x 630 pixels and should not be more than 8M, and
 Minimum image size is 200 x 200 pixels. || bgImgUrl | String | No | The path of the
 customized image, which can be a web image path. The image size is suggested to be 750
 x 825 pixels. || success | Function | No | The callback method that indicates a successful
 sharing. || fail | Function | No | The callback method that indicates a failed sharing. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || channelName | String | The sharing
 channel. || shareResult | Boolean | The result that indicates whether the sharing is
 successful. |

onTitleClick()

Trigger on clicking title.

onOptionMenuClick()

Trigger on clicking upper-right corner menu button.

onPopMenuItemClick()

Trigger on clicking upper-right corner general menu button.

onPullDownRefresh({from: manual | code})

Trigger on pulling down to refresh. It is required to enable pullRefresh in the window
 option of `app.json`. When the data refresh is processed completely, call
`my.stopPullDownRefresh` to stop the pull-to-refresh for that page.

onPullIntercept()

Trigger on pulling down interruption.

onTabItemTap(object: Object)

Trigger on clicking tabItem

Property	Type	Description
from	String	Click source.
pagePath	String	Page path of the clicked tabItem.
text	String	Button text of the clicked tabItem.
index	Number	Number of the clicked tabItem, starting from 0.

onPageScroll({scrollTop})

Trigger on page scrolling, scrollTop is the page scrolling distance.

onReachBottom()

Trigger on pulling page till bottom.

Events

To simplify codes, a new event handler object events is available. The existing page handler is equivalent to the exposed event functions on the page instance.

Notes:

- The support for events starts from basic library version 1.13.7.
- Please distinguish the basic library version requirements for the same named functions of the page event handler and events.

Below is the list of event functions supported by events:

Event	Type	Description	Lowest version
onBack	Function	Trigger on page returning.	1.13.7
onKeyboardHeight	Function	Trigger on keyboard height changing.	1.13.7
onOptionMenuClick	Function	Trigger on clicking upper-right corner menu button.	1.13.7
onPopupMenuClick	Function	Trigger on clicking upper-right corner general menu button.	1.13.7
onPullIntercept	Function	Trigger on pulling down interruption.	1.13.7
onPullDownRefresh	Function	Trigger on pulling down page.	1.13.7
onTitleClick	Function	Trigger on clicking title.	1.13.7
onTabItemTap	Function	Trigger on click non-current tabItem.	1.13.7
beforeTabItemTap	Function	Trigger before click non-current tabItem.	1.13.7
onResize	Function	Trigger on window size changing.	{size: {windowWidth: number, windowHeight: number}}
			1.16.0

Sample code:

copy

```
// Feature detection
my.canIUse('page.events.onBack');
```

```
Page({
  data: {
    text: 'This is page data.'
  },
  onLoad(){
    // trigger on page loading
  },
});
```

```
events:{  
    onBack(){  
        // Trigger on page returning  
    },  
    onKeyboardHeight(e){  
        // Trigger on keyboard height changing  
        console.log('keyboard height:', e.height)  
    },  
    onOptionMenuClick(){  
        // Trigger on clicking upper-right corner menu button  
    },  
    onPopMenuItemClick(e){  
        // Trigger on clicking custom menu buttons in upper-right  
        general menu  
        console.log('index of the clicked custom menu', e.index)  
        console.log('name of the clicked custom menu', e.name)  
        console.log('menuIconUrl of the clicked custom menu',  
e.menuIconUrl)  
    },  
    onPullIntercept(){  
        // Trigger on pulling down interruption  
    },  
    onPullDownRefresh(e){  
        // Trigger on pulling down page The e.from value "code"  
        indicates the event triggered by startPullDownRefresh; value "manual"  
        indicates the pull-down event trigger by user  
        console.log('type of triggered pull-down refresh', e.from)  
        my.stopPullDownRefresh()  
    },  
    onTitleClick(){  
        // Trigger on clicking title  
    },  
    onTabItemTap(e){  
        // e.from means triggering after clicking tabItem and switching;  
        value "user" indicates event triggered by user clicking; value "api"  
        indicates event triggered by switchTab  
        console.log('type of triggering tab change', e.from)  
        console.log('path of page corresponding to the clicked tab',  
e.pagePath)  
        console.log('text of the clicked tab', e.text)  
        console.log('index of the clicked tab', e.index)  
    },  
    beforeTabItemTap(){  
        // trigger on clicking tabItem but before switching  
    },  
    onResize(e){  
        // Trigger on window size changing  
        var {windowWidth, windowHeight} = e.size  
        console.log('width of changed window', windowWidth)  
        console.log('height of changed window', windowHeight)  
    },
```

```

    }
})

```

Page.prototype.setData(data: Object, callback: Function)

The `setData` sends data from logic layer to view layer and changes the value of `this.data`.

The `Object` is expressed in the form `key: Value`. The key value in `this.data` is changed to `value`. Here, the key can be flexibly provided in form of data path, such as `array[2].message`, `a.b.c.d`. It is not necessary to predefine in `this.data`.

The following points are worth attentions in use:

1. It is invalid to modify `this.data` directly, which will not change the page status and will cause data inconsistency.
2. Only the JSON supported data is supported.
3. Try not to set too many data once.
4. Do not set any value in the data as undefined, otherwise, that item will not be set, and potential issue may arise.

Sample code:

copy

```

<view>{{text}}</view>
<button onTap="changeTitle"> Change normal data </button>
<view>{{array[0].text}}</view>
<button onTap="changeArray"> Change Array data </button>
<view>{{object.text}}</view>
<button onTap="changePlanetColor"> Change Object data </button>
<view>{{newField.text}}</view>
<button onTap="addNewKey"> Add new data </button>
<view>hello: {{name}}</view>
<button onTap="changeName"> Change name </button>

```

copy

```

Page({
  data: {
    text: 'test',
    array: [{text: 'a'}],
    object: {
      text: 'blue',
    },
    name: 'Mini Program',
  },
  changeTitle() {

```

```

// Wrong! Do not modify the data directly
// this.data.text = 'changed data'

// Correct!
this.setData({
  text: 'ha',
});
},
changeArray() {
  // Possible to modify data by using directly data path
  this.setData({
    'array[0].text': 'b',
  });
},
changePlanetColor(){
  this.setData({
    'object.text': 'red',
  });
},
addNewKey() {
  this.setData({
    'newField.text': 'c',
  });
},
changeName() {
  this.setData({
    name: 'Mini Program',
  }, () => { // Accept transfer of callback function
    console.log(this); // this: current page instance
    this.setData({ name: this.data.name + ', ' + 'welcome!' });
  });
},
);
}
);

```

Parameter description:

Event	Type	Description	Lowest version	data	Object
Data to be changed.	callback	Function	Callback function, to be executed on completion of page rendering and update.	1.7.0, Use <code>my.canIUse('page.setData.callback')</code>	for compatibility processing.

Page.prototype.\$spliceData(data: Object, callback: Function)

Note: `$spliceData` is supported since version 1.7.2. The `my.canIUse('page.$spliceData')` can be used for compatibility processing.

Similarly, the `spliceData` is used to transfer data from logic layer to view layer, but has higher performance than `setData` in processing long list.

The `Object` is expressed in the form `key: Value..` The `key` value in `this.data` is changed to `value`. Here, the key can be flexibly provided in form of data path, such as `array[2].message`, `a.b.c.d`. It is not necessary to predefine in `this.data`. The `value` is an array (format: `[start, deleteCount, ...items]`). The first element of the array is the start position of the operation, the second element is the number of elements to be deleted, and other other elements are the insertion data. It maps the array `splice` method in es5.

Sample code:

copy

```
<!-- pages/index/index.axml -->
<view class="spliceData">
    <view a:for="{{a.b}}" key="{{item}}" style="border:1px solid red">
        {{item}}
    </view>
</view>
```

copy

```
// pages/index/index.js
Page({
    data: {
        a: {
            b: [1,2,3,4],
        },
    },
    onLoad(){
        this.$spliceData({ 'a.b': [1, 0, 5, 6] });
    },
});
```

Page output:

copy

```
1
5
6
2
3
4
```

Parameter description:

--- --- ---	Event	Type	Description	data Object Data to be changed.
callback Function	Callback function, to be executed on completion of page rendering and update.			

Page.prototype.\$batchedUpdates(callback: Function)

Batch update data.

Note: \$batchedUpdates is supported since version 1.14.0.

Them.y.canIUse('page.\$batchedUpdates') can be used for compatibility processing.

Parameter description:

--- --- ---	Event	Type	Description
callback	Function	The data operation in the callback function will be updated in batch.	

Sample code:

copy

```
// pages/index/index.js
Page({
  data: {
    counter: 0,
  },
  plus() {
    setTimeout(() => {
      this.$batchedUpdates(() => {
        this.setData({
          counter: this.data.counter + 1,
        });
        this.setData({
          counter: this.data.counter + 1,
        });
      });
    }, 200);
  },
});
```

copy

```
<!-- pages/index/index.axml -->
<view>{{counter}}</view>
<button onTap="plus">+2</button>
```

1. In this example, page counter adds 2 on each button clicking.

2. The `setData` is placed within `this.$batchedUpdates`. Thus, only one data transfer happens despite of multiple `setData`.

Page.route

Path of Page, mapping the path value configured in app.json, type `String`

This is a read-only attribute.

copy

```
Page({  
  onShow() {  
    // Map the path value configured in app.json  
    console.log(this.route)  
  }  
})
```

Payment capability {#payment-capability}

Last updated: 2022-07-03

Path: miniprogram_gcash

Payment capability

2022-07-03 18:44

Users can trigger the wallet cashier page on a mini program. The payment process and user experience on the mini program are similar to those of the native app.

Prerequisites

This capability is open to a merchant with a valid business license that is verified by its wallet. The merchant website should be accessible and provide clear business content and complete product information.

User experience

The overall payment process includes the following steps:

1. A user selects a product in the mini program and places an order.

2. The user confirms the purchase and enters the payment page that is triggered by the mini program.
3. The user confirms the payee and amount on the checkout page, then confirms the payment.
4. The payment success page is displayed.

Procedures

To develop the payment capability, follow the steps below:

1. Create a mini program

The merchant/ISV gets started with the workspace and publishes a mini program in the Mini Program Platform. For more information, see the [product guide overview](#) and the [developer guide](#).

2. Add features (Optional)

By default, the payment capability is available. For other features, you need to add a feature and define the details according to your business requirements. For more information, see [Features](#).

3. Call APIs

1. The wallet user creates a payment order in a mini program.
2. The merchant or ISV server creates the order by calling the `/{{version}}/payments/pay` OpenAPI from the wallet server.
3. The wallet server returns parameters such as `acquirementId` and `checkout URL` to the mini program.
4. The mini program calls the `tradePay` JSAPI by triggering the wallet payment process and other return parameters and then gets the response.
5. The user confirms the payment. Then the wallet server calls the `/{{version}}/payments/notifyPayment` OpenAPI and sends the order status notification to the min program server.
6. The user is redirected to the payment result page in the mini program.

Note:

- The `version` is the version of Open APIs, for example, `v1` or `v2`.
- The parameter `userId` or `uid` is fetched by calling the `applyToken` OpenAPI. For more information, see [User information capability](#).

API list

||| --- | --- || **JSAPI | Description** || [my.tradePay](#) | Trigger the cashier page from the wallet. || **OpenAPI | Description** || / {version}/payments/{apiName}
The **version** is the version of Open APIs, for example, v1 or v2. | For details, see the [Open APIs for Merchants](#) chapter. |

Performance {#performance}

Last updated: 2022-07-08

Path: miniprogram_gcash

Performance

2022-07-08 02:08

You can see the performance with historical data about the mini program. You can select one day before the current date, and see the following numbers on different card pages:

- **Unique Visitor by User**

The number of unique visitors on the selected date that are calculated by the user ID.

- **Unique Visitor by Device**

The number of unique visitors on the selected date that are calculated by the device ID.

- **Page View**

The number of page views on the selected date.

- **New Users**

The number of new users on the selected date.

- **7-Day Active Users**

The number of active users within the past 7 days till the selected date.

- **Accumulated Users**

The number of users that are accumulated from the first day of the mini program release to the selected date.

For each card, you can also see the growth rates, including the daily growth rate, week-over-week growth rate, and month-over-month growth rate.

Platform User's Guide

This product guide is intended for mini program platform users to learn the product features and procedures to manage the whole lifecycle of mini programs.

Mini Program is a new technology that helps you quickly develop high-quality services and grow your business on mobile apps with better user experience. With the Mini Program Development Platform, you can manage the whole lifecycle of mini programs. You can either directly create, develop, upload, release or remove mini programs, or authorize developers to manage min programs with an approval process. You can also see the data with analytics and quality functionality to improve efficiency.

Mini Program Development Platform

See the details of all the available features to manage the whole lifecycle of a mini program. [Learn more](#)

  display: flex;
  align-items: center;
  justify-content: center;
  width: 100%;
  height: 400px;
}
.demo-popover-btn {
  width: 100px;
  height: 100px;
  line-height: 100px;
  text-align: center;
  background-color: #fff;
  border: 1px solid #dddddd;
  border-radius: 2px;
}
.demo-popover-test-btns {
  display: flex;
  justify-content: space-around;
}
.demo-popover-test-btn {
  width: 45%;
}
```

Attributes

	Property	Description	Type	Default	Required
className	Outmost layout style.	String	-	No	show
show	Show bubble or not.	Boolean			
false	Yes				
showMask	Show mask or not.	Boolean	true	No	position
position	Bubble				
position options:	top, topRight, topLeft, bottom, bottomLeft, bottomRight, right, rightTop, rightBottom, left, leftBottom, leftTop.	String	bottomRight	No	

popover-item

	Property	Description	Type	
className	Single item style.	String

Popup {#popup}

Last updated: 2022-07-03

Path: miniprogram_gcash

Popup

2022-07-03 18:44

Popup window.

		Property	Description	Type	Default	Required
className	Custom class.	String	No	Boolean	false	
show	Show menu or not.	Boolean	false			
animation	Enable animation or not.	Boolean	true	No		
mask	Show mask or not. Clicking outside does not trigger onClose when it is not shown.	Boolean	true	Yes		
position	Control the direction in which the menu pops up. Bottom indicating the bottom side, left the left side, top the top side and right the right side.	String	bottom			
disableScroll	Disable page scroll or not when mask is shown.	Boolean	true	No		
zIndex	Define the number of popup levels.	Number	0	No		

Slots

It is possible to define the parts to be shown in the popup component. See the following example for details.

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "popup": "mini-antui/es/popup/index"
  }
}
```

copy

```
<view>
  <view class="btn-container">
    <button onTap="onTopBtnTap">Popup</button>
  </view>
  <popup show="{{showTop}}" position="top" onClose="onPopupClose">
    <view style="height: 200px; background: #fff; display: flex; justify-content: center; align-items: center;">hello world</view>
  </popup>
</view>
```

copy

```
Page({
  data: {
    showTop: false,
  },
})
```

```
onTopBtnTap() {
    this.setData({
        showTop: true,
    });
},
onPopupClose() {
    this.setData({
        showTop: false,
    });
},
});
```

Publish an event {#publish-an-event}

Last updated: 2022-07-07

Path: miniprogram_gcash

Publish an event

2022-07-07 17:08

After you complete defining an event, you can choose **Save & Publish** to publish the event. The event configuration is then completed and the system will start to retrieve data in about 5 minutes.

Note: After you publish an event, the **Event Name** and **Data Reporting Method** fields cannot be changed but other fields can still be modified.

Next steps

Quality {#quality}

Last updated: 2022-07-07

Path: miniprogram_gcash

Quality

2022-07-07 17:08

Quality is a real-time crash reporter that helps you track, prioritize, and fix stability issues that erode your mini program quality.

Features

You can perform the following activities within one or all version of a mini program:

- See the following statistics in a form of a graph within different time ranges:
 - **Total HTTP Requests:** The total number of HTTP requests.
 - **JSAPI Call Volume:** The total number of JSAPI calls.
 - **JSError Quantity:** The total number of JS errors.
 - **Abnormal Requests:** The total number of abnormal requests of HTTP requests or JSAPI calls.
 - **Affected Users:** The total number of users that are affected by JSErrors or loading exceptions.
- See the details of abnormal requests, and errors:
 - **Abnormal Request Details:** You can see abnormal URLs, error descriptions, error codes, and a total number of errors for each abnormal URL.
 - **JSError Details:** You can see the error stack description, total number of events caused by each JSError, and total number of affected users caused by each JS error.
 - **Abnormal Resource Files Details:** You can see abnormal URLs, error types, and a total number of errors for each abnormal URL.

Quick start {#quick-start}

Last updated: 2021-05-09

Path: miniprogram_gcash

Quick start

2021-05-09 18:43

This tutorial is designed to quickly get you started with developing a Mini Program quickly.

You can see the whole lifecycle of a mini program in the following figure:

Figure 1. Mini program lifecycle

Mini program development overview

The life-cycle of a mini program covers from the developer account creation to the release of the mini program.

Prerequisite

Before you can get started, make sure you have completed the following settings:

1. Apply for an account to join the Mini Program Platform

As a developer, you can join the platform to be a Mini Program admin or a Mini Program developer after you receive an email invitation.

2. Complete the on-boarding process
3. Create a mini program

- If you are a Mini Program admin, you can apply to create Mini Program on the Mini Program Platform and submit the Mini Program particulars, including but not limited to: name, description, logo image, etc. After successful creation, a unique identifier will be assigned to the newly created Mini Program.
- If you are a Mini Program developer, the Mini Program admin can add you as a member of a Mini Program.

4. Download Mini Program Studio

Develop & Debug in IDE

1. Create a project in Mini Program Studio
2. Link the project with the mini program that is created in the Mini Program Platform.
3. Code and debug
4. Upload the code package from Mini Program Studio to the Mini Program Platform.

Review & Release

1. Review the mini program and request to release the mini program
2. Workspace admin reviews and approves the release request.
3. Release the mini program.

Users can now open the mini program in the app.

Also, marketing capabilities can be enabled to the mini program for operational scenarios. And the life-cycle of a mini program ends when a mini program is removed from the Mini Program Platform.

Next steps

Developers can learn more about Mini Program in the Quick Start documentation:

- [Apply for an account.](#)
- [Run the first Mini Program quickly](#) by using the demo available in the Mini Program studio.
- [Know more about the Mini Program project structure.](#)
- According to the project structure knowledge, [learn more about the demo Mini Program.](#)
- [Learn how to publish a Mini Program.](#)

Real-time analysis {#real-time-analysis}

Last updated: 2022-07-07

Path: miniprogram_gcash

Real-time analysis

2022-07-07 17:08

You can see the real-time data about the mini program on the current date. You can also select one day before the current date or a time period from any date in the past week to the current date.

Features

You can benefit from the following features:

- **Overview**

You can see a data overview of the current date and daily growth rates of the following items:

- Number of users calculated by the user ID
- Number of users calculated by the device ID
- Page visits

It's also supported to select one day before the current date to view the data.

- **Page Visits**

You can select a time range to check the performance of every single page in a table, which includes the following fields:

- Page Path
- Visits
- Visitors
- New Visits by Shared Users
- Time on Page (sec)
- Shared Users
- Total Shares

- **Version Adoption**

You can select a time range to see the ratio of different mini program versions that are used by users.

- **Success Rate of JSAPI Calls**

You can see the payment success rate that is calculated by the total number of payment requests and the number of successful payments. The following JSAPIs are called for this capability:

- my.tradePay
- getAuthCode
- getOpenUserInfo

- **JSAPI errors**

You can see the error details, such as error code, description, number and time of occurrence, and so on.

The following JSAPIs are called for this capability:

- my.tradePay
- getAuthCode
- getOpenUserInfo

Register Mini Program {#register-mini-program}

Last updated: 2022-07-03

Path: miniprogram_gcash

Register Mini Program

2022-07-03 18:44

App(Object)

`App()` is used to register the Mini Program, accepts an object as the parameter to configure the lifecycle of Mini Program. `App()` should be called in `app.js` and only be called once.

Object Parameter Description

||||| --- | --- | --- || **Property** | **Type** | **Description** | **Trigger** || onLaunch | Function | Listening to Mini Program initialization. | On completion of Mini Program initialization, invoked only once. || onShow | Function | Listening to Mini Program showing. | On startup of Mini Program or switching to foreground from background. || onHide | Function | Listening to Mini Program hiding. | On switching Mini Program from foreground to background. || onError | Function | Listening to Mini Program error. | On js error of the Mini Program. || onUnhandledRejection | Function | Listen for the *unhandledrejection* event. | Triggered when a JavaScript Promise that has no rejection handler is rejected. |

Foreground/background definition:

- When the user leaves mobile app with the close button at upper-right corner or the device Home button, the Mini Program is not directly destroyed but switched to the background.
 - When mobile app is started or the Mini Program is opened again, it is switched to the foreground from the background.
 - Only when the Mini Program stays in background for a certain time or occupies too many system resources, it is destroyed.

onLaunch/onShow Options Parameter Description

||||| --- | --- | --- || **Property** | **Type** | **Description** || query | Object | Current Mini Program query, parsed from the query field in the startup parameter. || path | String | Current Mini Program page address, parsed from the page field in the startup parameter, home page by default when page is ignored. || referrerInfo | Object | Source information. ||

- This parameter can be obtained from the `onLaunch` method upon the first-time Mini Program startup
- The parameter can also be obtained from the `onShow` method when the Mini Program in background is reopened with schema.

copy

```
App({
  onLaunch(options) {
    // first opening
    console.log(options.query);
    // {number:1}
  },
  onShow(options) {
    // reopening with schema from background
    console.log(options.query);
    // {number:1}
  },
})
```

referrerInfo attribute description

Property	Type	Description	Compatibility
<code>appId</code>	<code>string</code>	Source Mini Program.	<code>1.11.0</code>
<code>sourceServiceId</code>	<code>String</code>	Source plug-in, visible in the plug-in running mode.	
<code>extraData</code>	<code>Object</code>	Data transferred from the source Mini Program.	

Notes:

- Do not operate page stack like `redirectTo/navigateTo` on the `onShow`.
- The basic library version used in `AppContainer` currently is `1.14.2`.

onHide()

The `onHide()` method will be triggered when Mini Program changes to background from foreground.

Sample code

copy

```
App({
  onHide() {
    // when changes to background
    console.log('app hide');
  },
});
```

onError()

The `onError()` method will be triggered when script error happens.

Sample code

copy

```
App({  
  onError(error) {  
    // the Mini Program script error happens  
    console.log(error);  
  },  
});
```

onUnhandledRejection()

The `onUnhandledRejection()` method will be triggered when a JavaScript Promise that has no rejection handler is rejected.

Sample code

copy

```
App({  
  onUnhandledRejection(res) {  
    // A JavaScript Promise that has no rejection handler is rejected.  
    console.log(res.reason, res.promise);  
    //res.reason describes the rejection reason and res.promise  
describes the rejected Promise.  
  },  
});
```

Global Data

Global data can be configured in `App()`. Other pages can get and modify the global data directly.

Sample code

copy

```
// app.js  
App({  
  globalData: 1  
});
```

FAQ

Q: Can Mini Program be closed in app.js?

A: No, Mini Program can only be closed by clicking close button in the top right corner.

Register Mini Program

2021-05-09 18:43

App(Object)

`App()` is used to register the Mini Program, accepts an object as the parameter to configure the lifecycle of Mini Program. `App()` should be called in `app.js` and only be called once.

Object Parameter Description

||||| --- | --- | --- || **Property** | **Type** | **Description** | **Trigger** || onLaunch | Function | Listening to Mini Program initialization. | On completion of Mini Program initialization, invoked only once. || onShow | Function | Listening to Mini Program showing. | On startup of Mini Program or switching to foreground from background. || onHide | Function | Listening to Mini Program hiding. | On switching Mini Program from foreground to background. || onError | Function | Listening to Mini Program error. | On js error of the Mini Program. || onUnhandledRejection | Function | Listen for the *unhandledrejection* event. | Triggered when a JavaScript Promise that has no rejection handler is rejected. |

Foreground/background definition:

- When the user leaves mobile app with the close button at upper-right corner or the device Home button, the Mini Program is not directly destroyed but switched to the background.
 - When mobile app is started or the Mini Program is opened again, it is switched to the foreground from the background.
 - Only when the Mini Program stays in background for a certain time or occupies too many system resources, it is destroyed.

onLaunch/onShow Options Parameter Description

||||| --- | --- | --- || **Property** | **Type** | **Description** || query | Object | Current Mini Program query, parsed from the query field in the startup parameter. || path | String | Current Mini Program page address, parsed from the page field in the startup parameter, home page by default when page is ignored. || referrerInfo | Object | Source information. ||

- This parameter can be obtained from the onLaunch method upon the first-time Mini Program startup
- The parameter can also be obtained from the onShow method when the Mini Program in background is reopened with schema.

copy

```
App({
  onLaunch(options) {
    // first opening
    console.log(options.query);
    // {number:1}
  },
  onShow(options) {
    // reopening with schema from background
    console.log(options.query);
    // {number:1}
  },
})
```

referrerInfo attribute description

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** | **Compatibility** || appId | string | Source Mini Program. || sourceServiceId | String | Source plug-in, visible in the plug-in running mode. | 1.11.0 || extraData | Object | Data transferred from the source Mini Program. ||

Notes:

- Do not operate page stack like redirectTo/navigateTo on the onShow.
- The basic library version used in AppContainer currently is 1.14.2.

onHide()

The onHide() method will be triggered when Mini Program changes to background from foreground.

Sample code

copy

```
App({
  onHide() {
    // when changes to background
    console.log('app hide');
```

```
  },
});
```

onError()

The `onError()` method will be triggered when script error happens.

Sample code

copy

```
App({
  onError(error) {
    // the Mini Program script error happens
    console.log(error);
  },
});
```

onUnhandledRejection()

The `onUnhandledRejection()` method will be triggered when a JavaScript Promise that has no rejection handler is rejected.

Sample code

copy

```
App({
  onUnhandledRejection(res) {
    // A JavaScript Promise that has no rejection handler is rejected.
    console.log(res.reason, res.promise);
    //res.reason describes the rejection reason and res.promise
describes the rejected Promise.
  },
});
```

Global Data

Global data can be configured in `App()`. Other pages can get and modify the global data directly.

Sample code

copy

```
// app.js
App({
  globalData: 1
});
```

FAQ

Q: Can Mini Program be closed in app.js?

A: No, Mini Program can only be closed by clicking close button in the top right corner.

Release Custom Component

2022-07-03 18:44

Mini program natively supports the introduction of third-party npm module, so the customized component also supports publishing to npm for developers to reuse and share.

Customized Component Directory Recommended for Publishing

The following directory structure is for reference only.

File Structure

copy

```
|__ src // used for individually customized component
|   |__ index.js
```

```

    └── index.json
    └── index.axml
    └── index.acss
    └── demo //used for demo of customized component
        ├── index.js
        ├── index.json
        ├── index.axml
        └── index.acss
    └── app.js // used for demo of customized component Mini Program
    └── app.json
    └── app.acss

```

JSON Sample

copy

```
// package.json
{
  "name": "your-custom-component",
  "version": "1.0.0",
  "description": "your-custom-component",
  "repository": {
    "type": "git",
    "url": "your-custom-component-repository-url"
  },
  "files": [
    "es"\n  ],
  "keywords": [
    "custom-component",\
    "mini-program"\n  ],
  "devDependencies": {
    "rc-tools": "6.x"
  },
  "scripts": {
    "build": "rc-tools run compile && node scripts/cp.js && node scripts/rm.js",
    "pub": "git push origin && npm run build && npm publish"
  }
}
```

js File Sample

copy

```
// scripts/cp.js
const fs = require('fs-extra');
const path = require('path');
// copy file
fs.copySync(path.join(__dirname, '../src'), path.join(__dirname,
```

```
'..../es'), {
  filter(src, des){
    return !src.endsWith('.js');
  }
});

copy

// scripts/rm.js
const fs = require('fs-extra');
const path = require('path');
// remove unnecessary file
const dirs = fs.readdirSync(path.join(__dirname, '../es'));
dirs.forEach(item) => {
  if (item.includes('app.') || item.includes('DS_Store') ||
  item.includes('demo')) {
    fs.removeSync(path.join(__dirname, '../es/', item));
  } else {
    const moduleDirs = fs.readdirSync(path.join(__dirname, '../es/',
    item));
    moduleDirs.forEach(item2) => {
      if (item2.includes('demo')) {
        fs.removeSync(path.join(__dirname, '../es/', item, item2));
      }
    });
  }
});
fs.removeSync(path.join(__dirname, '../lib/'));
```

Release Mini Program {#release-mini-program}

Last updated: 2022-07-03

Path: miniprogram_gcash

Release Mini Program

2022-07-03 18:44

Till now, the Mini Program being developed can be run inside the IDE Simulator. Only after the release, the Mini Program will be available on the AppContainer-integrated mobile app.

Create Mini Program

Before the release, the Mini Program should be created in the Mini Program Development Platform. If you are a Mini Program admin, you can create a new Mini Program on the platform. If you are a normal developer, you need to ask the Mini Program admin to add you to the group of the newly created Mini Program.

Mini Program admin can create a new Mini Program in the Mini Program Development Platform.

Add Member in Mini Program

If you are a normal Mini Program developer, please contact your Mini Program admin to add you into the members of the Mini Program. And if you are a Mini Program admin, please add the developers in the specific Mini Program.

Log into IDE

Make sure the IDE is in the login page. Click the login button at the upper-right corner to show the login dialog and fill in your account to log in.

Preview

The preview function allows the developer to preview the Mini Program in an actual device.

The preview function requires login via QR code and selection of associated application.

Upload

When the Mini Program is ready to upload, click the upper-right corner to upload them. After confirmation, the codes are uploaded to the Mini Program platform. Now a development version Mini Program is generated in the platform. If you click upload several times, a new version Mini Program will be generated. Note that the newer version does not overwrite the older one.

Submit for Reviewing

Only Mini Program admin can submit for the reviewing, the admin can log into the platform, find the version that developer has uploaded, and click the apply button to apply for review. And then wait for the reviewing result of the Mini Program.

Release Mini Program

When the review process of the Mini Program is complete, Mini Program admin would be able to select either perform a staged release or a full release to push the Mini Program to production.

Release mini programs {#release-mini-programs}

Last updated: 2022-11-13

Path: miniprogram_gcash

Release mini programs

2022-11-13 15:01

This topic describes the steps of the task to publish a mini program. When the mini program is ready to be released, developer admins can apply for publishing the mini program.

Procedures

To release a version, you can follow the corresponding steps as below:

Step 1: Version created

After uploading a version from Mini Program Studio (IDE) to the workspace, click **Mini Program** on the left menu panel and go to the **Versions** page of a mini program. You can release the version to different apps:

- **The current app** is the app where you create the mini program. The current app is added to the **App Manage** automatically after creating a workspace.
- **Target apps** are added by the wallet in the **App Manage**.

The current app

You can release the mini program to the current app in two ways:

- Choose App
- Release

Choose App

To release the mini program to different environments of the current app or other target apps configured by the wallet, Click **Choose App**.

Select the current app and choose an environment. Then click **Select** to trigger the release process.

| **Note:** You cannot release a mini program to the same environment repeatedly.

Release

To directly release the mini program to the production environment, click **Release** to trigger the release process.

Target apps

To release the version to target apps, click **Choose App** to continue.

Select a target app you want and an environment. Then click **Select** to trigger the release process.

| **Note:** You cannot release a mini program to the same environment repeatedly.

Whether to release the version to the current app or target apps, the release process continues with package building automatically. You can check and modify the configurations at this step by clicking **View Configuration**.

Then you can click **Apply to Release** to check the basic information, server domain whitelist, and H5 domain whitelist. Currently, only the basic information is supported to modify in the release process. After confirming the basic information, click **Apply**.

Step 2: Under review

The release request of the version is sent to the wallet for approval.

Step 3: Pilot testing

After the request is approved, you can set the tester whitelist to conduct the pilot testing.

Click **Set Test Whitelist** to add tester emails and then click **Add**.

During the pilot testing, you can choose to add or delete testers to update the tester whitelist.

After the pilot testing is finished, click **Finish Pilot Testing** and then click **Complete** to enter the grayscale release.

Step 4: Grayscale release (Optional)

Click **Confirm** to trigger the grayscale release.

The grayscale ratio range is from 1%-100%. You can choose to conduct the grayscale by selecting any of ratios within the range. For example, if you want to release the mini program at 1% grayscale, select 1% and click **Confirm** to trigger the process. You can find problems and make adjustments at the initial grayscale.

If everything goes well, you can gradually increase the ratio to 100% to fully release the version. Then the whole release process comes to the end.

Step 5: Final release

If the version is ready to run online after the pilot testing, click **Final Release** to fully release the version directly. And the whole release process comes to the end at this step.

Now you have completed releasing a mini program version.

Remote Debugging {#remote-debugging}

Last updated: 2021-05-09

Path: miniprogram_gcash

Remote Debugging

2021-05-09 18:43

For ease of real machine debugging, the Mini Program Studio provides the remote real machine debugging function. With the remote real machine debugging, you can:

- Perform breakpoint debugging of remote Mini Program in IDE
- View the AXML structure and style of remote interface in IDE
- View cellphone's network, storage and other information in IDE
- View Mini Program running log on cellphone in IDE

Click Debug in the top-right toolbar and confirm to push and generate debugging QR code:

After scanning with the app, the simulator shows the connection information. Meanwhile the cellphone shows the remote debugging mode has been connected. Now you can open the DevTool window to debug.

For example, you can normally inspect axml elements.

And you can perform break point debugging. Just select the Sources tab of the devtool, and then choose the specific js file. You can simple click the line number to add break point or right click the line number to show the break point prompt and then add a conditional break point. If the break point hits, the break pint line will become blue and there will be a hint in the phone showing break point hits.

Attention in the remote debugging: make sure to disconnect remote debugging after modifying code each time, and then push again, repeat the steps to scan to connect and perform remote debugging.

Remove mini programs {#remove-mini-programs}

Last updated: 2022-07-07

Path: miniprogram_gcash

Remove mini programs

2022-07-07 17:08

Overview

This topic provides steps for merchants to remove mini programs. To remove a mini program means that the mini program will be offline but still reserve its services in the workspace. If you want to stop running a mini program online, you can remove it.

Procedures

To remove a mini program, you can follow the corresponding steps as below:

Step 1: Navigate to mini program list

Click **Mini Program** on the menu panel to the left and choose the mini program from the list.

Step 2: Remove a mini program

Choose the mini program you want to remove and confirm its details. Then click **Apply for Removal**.

Click **Remove** to send the removal request to the wallet for review.

You can check the approval status by clicking **View Removal Application** under the **Versions** tab.

Once the request is approved, you can click **Remove Mini Program** to remove it.

You can then go to the mini program list page to check that the mini program is marked as **Archived**.

Now you have completed removing a mini program.

SearchBar {#searchbar}

Last updated: 2022-07-03

Path: miniprogram_gcash

SearchBar

2022-07-03 18:44

The search function allows text query for the users. On basis of the current page contents, the user can perform exact search or fuzzy search to filter and locate contents and increase productivity in queries. When the search bar is activated, the cancel button appears. Note: For the purpose of UI presentation only. No service logic function is available.

Sample Code

copy

```
// API-DEMO page/component/search-bar/search-bar.json
{
  "defaultTitle": "Mini Program AntUI component library",
  "usingComponents": {
    "search-bar": "mini-antui/es/search-bar/index"
  }
}
```

copy

```
<!-- API-DEMO page/component/search-bar/search-bar.axml -->
<view>
  <search-bar
    value="{{value}}"
    placeholder="Search "
    onInput="handleInput"
    onClear="handleClear"
    onFocus="handleFocus"
    onBlur="handleBlur"
    onCancel="handleCancel"
    onSubmit="handleSubmit"
    showCancelButton="{{false}}" />
</view>
```

copy

```
// API-DEMO page/component/search-bar/search-bar.js
Page({
  data: {
    value: 'Food',
  },
  handleInput(value) {
    this.setData({
      value,
    });
  },
  handleClear(value) {
    this.setData({
      value: '',
    });
  },
});
```

```

        handleFocus() {},
        handleBlur() {},
        handleCancel() {
            this.setData({
                value: '',
            });
        },
        handleSubmit(value) {
            my.alert({
                content: value,
            });
        },
    );
}

```

Attributes

	Property	Description	Type	Default	Required
value	Current value in search box.	String - No	placeholder	Placeholder. String - No	focus Get cursor automatically.

Boolean | false | No | onInput | Trigger on keyboard input. | (value: String) => void | - | No | onClear | Trigger on clicking clear icon. | (val: String) => void | - | No | onFocus | Trigger on getting focus. | () => void | - | No | onBlur | Trigger on losing focus. | () => void | - | No | onCancel | Trigger on clicking cancel. | () => void | - | No | onSubmit | Trigger on clicking enter on button. | (val: String) => void | - | No | disabled | Set disabled. | Boolean | - | No | maxLength | Maximum number of characters allowed for input Number. | - | No | showCancelButton | Always show cancel button or not. | Boolean | - | No |

SelectorQuery Overview {#selectorquery-overview}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery Overview

2021-05-09 18:43

The class of selector query object.

Functions

||||---|| --- || **Name** | **Description** || SelectorQuery.boundingClientRect | Put the location of current selected node into the query result. || SelectorQuery.exec | Put the query result into the Callback. || SelectorQuery.scrollOffset | Put the scroll of current selected node into the query result. || SelectorQuery.select | Select the first matched node. || SelectorQuery.selectAll | Select all the matched nodes. || SelectorQuery.selectViewport | The instance of select window. |

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_ui_selector-query_query_SelectorQuery-overview

SelectorQuery.boundingClientRect {#selectorqueryboundingclientrect}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery.boundingClientRect

2021-05-09 18:43

Put the location of the current selected node into the query result. It is similar to the `getBoundingClientRect` of DOM, the returned value includes width, height, left, top, bottom, right. If current node is window object, only width and height will be returned.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_ui_selector-query_query_SelectorQuery-boundingclientrect

SelectorQuery.exec {#selectorqueryexec}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery.exec

2021-05-09 18:43

Put the query result into callback function. The query result is an array according to the query sequence, the object in the array is the result of each query. If the selected node is the list of node, the query result of the single query is also an array.

Note: The exec should be invoked after the `onReady` of the page.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_ui_selector-query_query_selectorquery-exec

SelectorQuery.scrollOffset {#selectorqueryscrolloffset}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery.scrollOffset

2021-05-09 18:43

Put the scroll information of current selected node into the query result, the returned value includes scrollTop, scrollLeft.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_ui_selector-query_query_selectorquery-scrolloffset

SelectorQuery.select {#selectorqueryselect}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery.select

2021-05-09 18:43

Select the first node that matches the selector, the selector can support ID selector and class selector.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_ui_selector-query_query_selectorquery-select

SelectorQuery.selectAll {#selectorqueryselectall}

Last updated: 2021-05-09

Path: miniprogram_gcash

SelectorQuery.selectAll

2021-05-09 18:43

Select all the nodes that match the selector, the selector can support ID selector and class selector.

Settings

2022-07-03 18:44

Click the settings icon in the bottom-left corner to enter the settings interface. The settings mainly contains following ways:

- Global settings or workspace settings about the editor and other coding related settings.

- Shortcuts settings.
- Appearance settings such as theme of color and icon.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/mini-program-studio_settings

Settings {#settings}

Last updated: 2022-07-07

Path: miniprogram_gcash

Settings

2022-07-07 17:08

The **Settings** functionality enables workspace admins to customize the platform according to different business requirements. Other member roles can only set the two-factor authentication with this functionality.

Features

As a workspace admin, you can change the following settings:

- **Logo & Favicon**

Change the logo displayed on your customized Mini Program platform and console, and the favicon displayed on the web browser tab.

- **Service Mail Preference**

Set your noreply email, which enables you to send outgoing emails that do not accept replies. This prevents your email inbox from being overloaded with replies.

- **Domain Preference**

Customize your domain name.

- **Whitelist for Mini Program Testers (Optional)**

Workspace admins enable gray-box testing for designated testers, then developers can add tester accounts to the whitelist under **Mini Program > Configuration > Whitelist for Mini Program Testers**.

Notes:

- The maximum number of the tester accounts is 100.
- To use this feature, the Griver and WallerAPI version in the App Container must meet the following requirements:
 - Griver 2.16.0 or higher
 - WalletAPI 0.4.4 or higher
- **Two-Factor Authentication**

You can set up the 2FA to add an extra layer of security for your Mini Program platform account. For more information, see [Set Two-Factor Authentication](#) on how to enable this feature.

- **URL of About Us**

Customize a link for your **About Us** page. By the clickable text on your portal homepage, you can link the Mini Program platform with one of your websites.

- **Term of Service Agreement**

You can upload the agreement. By the clickable text on your portal homepage, your users can preview or download the agreement file.

- **Copyright Notice**

You can enter the texts in the format of a symbol, a year and an owner to define your copyright notice, which is displayed on the portal homepage.

Simulator {#simulator}

Last updated: 2022-07-03

Path: miniprogram_gcash

Simulator

2022-07-03 18:44

After the Mini Program project builds, it will run in the simulator automatically. You can click and slide in the screen to simulate the click and slide motion in real device.

By default, each time saving the changes of the code, the simulator will refresh automatically to achieve real-time update. If you want to disable the feature, cancel the auto refresh selection in the bottom of the simulator.

The top of the simulator window mainly contains following functions:

- Device switch: choose different size devices including iOS and Android. You can also create a custom device.
- Scale control: control the scale of the Mini Program.
- Refresh: compile the project and refresh the simulator.
- Tools: tools for simulation data such as you can mock the location.
- Simulation log: check the compile logs.
- Standalone window: set the simulator to a standalone window.

The bottom of the simulator window mainly contains following functions:

- Page path: show current page path. Click the path, the relative .js file will be opened automatically.
- Page params: show the parameters of current page.
- Auto refresh: checkbox for auto refresh of simulator.

Device Switch

The developer can select different devices or add custom device to debug the adaptation problem of Mini Program on the models of different sizes.

Scale Control

The developer can scale the display of the simulator via preset percentages.

Simulation Tools

The simulation tools is a useful function for developers. Click the tools menu, you can display or hide the tools panel.

Home

Click the Home button, the Mini Program will go to background, which can be used to test `onShow` and `onHide` function in `app.js` or `page.js`.

Location

Click the Location button, you can mock the location of simulator. Then `my.getLocation` will return the mocked data.

Note:

Float data is required when inputting the longitude and latitude.

Scan

Mock the `my.scan` API, you can input the scan result, then in Mini Program, `my.scan` will get the mocked data.

Shake

Simulate the shake of the device, used to test `my.watchShake` API.

Corp

Simulate the capture screen event of users, used to test `my.onUserCaptureScreen` API.

MemWarn

Simulate the memory warning event of app, used to test `my.onMemoryWarning` API.

  <list-item disabled="{{true}}">
    readOnly
    <view slot="extra">
      <stepper onChange="callBackFn" showNumber value="{{11}}"
min="{{2}}" max="{{12}}" readOnly />
    </view>
  </list-item>
```

```

        </view>
    </list-item>
    <list-item>
        <button onTap="modifyValue">Modify stepper initial
value</button>
    </list-item>
</list>

```

copy

```
// API-DEMO page/component/stepper/stepper.js
Page({
  data: {
    value: 8,
  },
  callBackFn(value){
    console.log(value);
  },
  modifyValue() {
    this.setData({
      value: this.data.value + 1,
    });
  }
});
```

Attributes

		Property	Description	Type	Default	Required
min						
Minimum.	Number	0 Yes	Maximum.	Number 10000 Yes	value Initial	
onChange						
Change callback function.	(value: Number) => void - No					
Disabled.	Boolean false No					
readOnly						
Input read-only.	Boolean false No					
showNumber						
Show number or not, not shown by default.	Boolean false No					

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/extended-component_others_stepper

Steps {#steps}

Last updated: 2022-07-03

Path: miniprogram_gcash

Steps

2022-07-03 18:44

Show the progress bar as per the steps.

	Property	Description	Type	Default	Required
className	Outermost layer overlapping style.	String	No	activeIndex	Current active step.

Number | 1 | Yes | failIndex | Current failed step (effective only in vertical mode). | Number | 0 | No | direction | Displaying direction, options including

vertical and horizontal. | String | horizontal | No | size | Uniform icon size, in px. |

Number | 0 | No | items | Step details. | Array[{title, description, icon, activeIcon, size}]

| [] | Yes |

Items attribute detailed description

	Property	Description	Type	Required	items.title	Title of step details. String Yes
items.description	Description of step details.	String	Yes	items.icon	Icon for unreached step (effective only in vertical mode). String Yes	
items.activeIcon	Icon for reached step (effective only in vertical mode) String Yes	items.size	Size of icon for reached step, in px. (effective only in vertical mode)	Number Yes		

Example

copy

```
{
  "usingComponents": {
    "steps": "mini-antui/es/steps/index"
  }
}
```

copy

```
<steps
  activeIndex="{{activeIndex}}"
  items="{{items}}"
/>
```

copy

```
Page({
  data: {
    activeIndex: 1,
    items: [{}\
      title: 'Step one',\
      description: 'This is step one',\
    ], {\
      title: 'Step two',\
      description: 'This is step two',\
    }, {\
      title: 'Step three',\
      description: 'This is step three',\
    }]
  }
})
```

```
    }  
});
```

Suggestions on Performance Optimization {#suggestions-on-performance-optimization}

Last updated: 2021-05-09

Path: miniprogram_gcash

Suggestions on Performance Optimization

2021-05-09 18:43

Operating Principle

Different from the traditional H5 applications, Mini Program operation architecture is divided into two parts -- webview and worker. The webview is for rendering, and the worker is for data storage and service logic execution.

1. Communication between webview and worker is asynchronous. This means the data is not rendered immediately when setData is called, and asynchronous transmission from worker to webview occurs.
2. During the transmission, the data is serialized as a string, and transferred by means of evaluateJavascript. The data size affects the performance.

Optimizing First Screen

The first screen may be defined differently. Here it means the first meaningful render of the service. For example: with regard to a list page, the first screen means the contents rendered for the first time in the list.

Controlling Size of Mini Program Resource Package

When the user accesses Mini Program for the first time, mobile App client downloads Mini Program resource package from CDN, so the size of the resource package affects the Mini Program startup performance.

Optimization suggestions

- Delete the useless image resources, because all image resources are packaged by default.
- Control the size of images and avoid using large picture. It is recommended to upload large pictures via CDN channels.
- Clear useless codes in time

Advance Data Request to onLoad

- Upon operation, Mini Program triggers the onLoad lifecycle function of the page, and then transfers the initial page data from worker to webview for the initial render.
- When the initial page render is completed, a notification is sent from webview to worker and triggers the onReady lifecycle function.

Some Mini Programs send requests in onReady which causes delay of first screen render.

Optimization suggestion

Advance data request to onLoad

Control the Number of Nodes to Be Rendered at Once in the First Screen

After the service request is returned, it generally calls the setData to trigger page re-render. The execution process is as below:

1. Data is sent from worker to webview
2. webview constructs virtual DOM as per the data transferred, makes difference comparison with the previous data (starting from the root node), and starts render.

Due to the data serialization in communication from worker to webview, and then the execution of evaluateJavascript in the webview, the first screen render performance is affected if the data transmitted once is too large.

in addition, if the construction nodes are too many or the nested hierarchy is too deep on webview, say, more than 100 list items to be rendered once in the list page of some Mini Program and each list item containing nested contents, but less than 10 items to be displayed on the whole screen, the different comparison takes long time, a large number of DOMs are constructed once in the first screen, and the first screen render performance is compromised.

Optimization suggestions

- setData data quantity should not be too large; do not transfer too long list once.
- Do not construct too many nodes on the first screen. The service end may request a large quantity of data once. Do not run setData all at once. It is possible to setData partial data and wait for a while (say, 400ms, depending on the specific service) and then call \$spliceData to transfer the remaining data.

Optimize setData Logic

Any page change triggers setData. At the same time, multiple setData may trigger the page re-render. The following four interfaces trigger webview page re-render.

- **Page.prototype.setData:** Triggers the difference comparison of the whole page
- **Page.prototype.\$spliceData:** Optimizes long list and avoid transferring whole list all at once and triggering the difference comparison of the whole page
- **Component.prototype.setData:** Starts the difference comparison from the corresponding component node
- **Component.prototype.\$spliceData:** Optimizes long list and avoid transferring whole list all at once. Only makes difference comparison from the corresponding component node.

Optimization suggestions

- Avoid triggering setData or \$spliceData frequently, no matter on the page level or component level. In our analyzed cases, some pages contain countdown logic but the countdown is triggered too frequently (in microseconds).
- When it is required to trigger re-render frequently, avoid using page-level setData or \$spliceData. This block can be encapsulated into a custom component, and then the component-level setData and \$spliceData can be used to trigger component re-render.
- For render of long data list, use \$spliceData to append data in several times instead of transfer of the whole list.
- For complicated page, it is recommended to encapsulate it into custom component to minimize the page-level setData.

Optimization case

Suggest specifying path to set data:

copy

```
this.setData({
  'array[0]': 1,
  'obj.x':2,
});
```

Not suggesting the following method (although this.data is copied, the attribute is changed directly):

copy

```
const array = this.data.array.concat();
array[0] = 1;
const obj={...this.data.obj};
obj.x=2;
this.setData({array,obj});
```

Even not suggesting direct change of this.data (violating the immutable data principle):

copy

```
this.data.array[0]=1;
this.data.obj.x=2;
this.setData(this.data)
```

Using \$spliceData for long list

copy

```
this.$spliceData({ 'a.b': [1, 0, 5, 6] })
```

Note:

Sometimes when service logic are encapsulated in component, it is only required to call setData within the component when the component UI needs re-render. In other occasions, however, it is required to trigger component re-render from the page. For example, the onPageScroll event is monitored on page, and it is required to notify the corresponding component to render again when the event is triggered. Now the measure is as below:

copy

```
// /pages/index/index.js
Page({
  onPageScroll(e) {
    if (this.xxcomponent) {
      this.xxcomponent.setData({
        scrollTop: e.scrollTop
      })
    }
  }
})
// /components/index/index.js
Component({
  didMount(){
    this.$page.xxcomponent = this;
  }
})
```

It is possible to mount the component to the corresponding page in the didMount, so that the call of component-level setData in the page triggers re-render of the component only.

Use Key Parameter

The “key” can be used in “for” to increase performance. Note that the “key” cannot be set on blocks.

Sample codes:

copy

```
<view a:for="{{array}}" key="{{item.id}}"></view>
<block a:for="{{array}}><view key="{{item.id}}"></view></block>
```

Suggestions on Performance Optimization

2022-07-03 18:44

Operating Principle

Different from the traditional H5 applications, Mini Program operation architecture is divided into two parts -- webview and worker. The webview is for rendering, and the worker is for data storage and service logic execution.

1. Communication between webview and worker is asynchronous. This means the data is not rendered immediately when setData is called, and asynchronous transmission from worker to webview occurs.
2. During the transmission, the data is serialized as a string, and transferred by means of evaluateJavascript. The data size affects the performance.

Optimizing First Screen

The first screen may be defined differently. Here it means the first meaningful render of the service. For example: with regard to a list page, the first screen means the contents rendered for the first time in the list.

Controlling Size of Mini Program Resource Package

When the user accesses Mini Program for the first time, mobile App client downloads Mini Program resource package from CDN, so the size of the resource package affects the Mini Program startup performance.

Optimization suggestions

- Delete the useless image resources, because all image resources are packaged by default.
- Control the size of images and avoid using large picture. It is recommended to upload large pictures via CDN channels.
- Clear useless codes in time

Advance Data Request to onLoad

- Upon operation, Mini Program triggers the onLoad lifecycle function of the page, and then transfers the initial page data from worker to webview for the initial render.
- When the initial page render is completed, a notification is sent from webview to worker and triggers the onReady lifecycle function.

Some Mini Programs send requests in onReady which causes delay of first screen render.

Optimization suggestion

Advance data request to onLoad

Control the Number of Nodes to Be Rendered at Once in the First Screen

After the service request is returned, it generally calls the setData to trigger page re-render. The execution process is as below:

1. Data is sent from worker to webview
2. webview constructs virtual DOM as per the data transferred, makes difference comparison with the previous data (starting from the root node), and starts render.

Due to the data serialization in communication from worker to webview, and then the execution of evaluateJavascript in the webview, the first screen render performance is affected if the data transmitted once is too large.

in addition, if the construction nodes are too many or the nested hierarchy is too deep on webview, say, more than 100 list items to be rendered once in the list page of some Mini Program and each list item containing nested contents, but less than 10 items to be displayed on the whole screen, the different comparison takes long time, a large number of DOMs are constructed once in the first screen, and the first screen render performance is compromised.

Optimization suggestions

- setData data quantity should not be too large; do not transfer too long list once.
- Do not construct too many nodes on the first screen. The service end may request a large quantity of data once. Do not run setData all at once. It is possible to setData partial data and wait for a while (say, 400ms, depending on the specific service) and then call \$spliceData to transfer the remaining data.

Optimize setData Logic

Any page change triggers setData. At the same time, multiple setData may trigger the page re-render. The following four interfaces trigger webview page re-render.

- **Page.prototype.setData:** Triggers the difference comparison of the whole page
- **Page.prototype.\$spliceData:** Optimizes long list and avoid transferring whole list all at once and triggering the difference comparison of the whole page
- **Component.prototype.setData:** Starts the difference comparison from the corresponding component node
- **Component.prototype.\$spliceData:** Optimizes long list and avoid transferring whole list all at once. Only makes difference comparison from the corresponding component node.

Optimization suggestions

- Avoid triggering setData or \$spliceData frequently, no matter on the page level or component level. In our analyzed cases, some pages contain countdown logic but the countdown is triggered too frequently (in microseconds).
- When it is required to trigger re-render frequently, avoid using page-level setData or \$spliceData. This block can be encapsulated into a custom component, and then the component-level setData and \$spliceData can be used to trigger component re-render.
- For render of long data list, use \$spliceData to append data in several times instead of transfer of the whole list.
- For complicated page, it is recommended to encapsulate it into custom component to minimize the page-level setData.

Optimization case

Suggest specifying path to set data:

copy

```
this.setData({
  'array[0]': 1,
  'obj.x':2,
});
```

Not suggesting the following method (although this.data is copied, the attribute is changed directly):

copy

```
const array = this.data.array.concat();
array[0] = 1;
const obj={...this.data.obj};
obj.x=2;
this.setData({array,obj});
```

Even not suggesting direct change of this.data (violating the immutable data principle):

copy

```
this.data.array[0]=1;
this.data.obj.x=2;
this.setData(this.data)
```

Using \$spliceData for long list

copy

```
this.$spliceData({ 'a.b': [1, 0, 5, 6] })
```

Note:

Sometimes when service logic are encapsulated in component, it is only required to call setData within the component when the component UI needs re-render. In other occasions, however, it is required to trigger component re-render from the page. For example, the onPageScroll event is monitored on page, and it is required to notify the corresponding component to render again when the event is triggered. Now the measure is as below:

copy

```
// /pages/index/index.js
Page({
  onPageScroll(e) {
    if (this.xxcomponent) {
      this.xxcomponent.setData({
        scrollTop: e.scrollTop
      })
    }
  }
})
// /components/index/index.js
Component({
  didMount(){
    this.$page.xxcomponent = this;
  }
})
```

It is possible to mount the component to the corresponding page in the didMount, so that the call of component-level setData in the page triggers re-render of the component only.

Use Key Parameter

The “key” can be used in “for” to increase performance. Note that the “key” cannot be set on blocks.

Sample codes:

copy

```
<view a:for="{{array}}" key="{{item.id}}"></view>
<block a:for="{{array}}><view key="{{item.id}}></view></block>
```

SwipeAction

2022-07-03 18:44

Sliding cell

Sample Code

copy

```
// API-DEMO page/component/swiper-action/swiper-action.json
{
    "defaultTitle": "SwipeAction",
    "usingComponents": {
        "list": "mini-antui/es/list/index",
        "list-item": "mini-antui/es/list/list-item/index",
        "swipe-action": "mini-antui/es/swipe-action/index"
    }
}
```

copy

```
<!-- API-DEMO page/component/swiper-action/swiper-action.axml -->
<view>
    <list>
        <view a:for="{{list}}" key="{{item.content}}>
            <swipe-action
                index="{{index}}"
                restore="{{swipeIndex === null || swipeIndex !== index}}"
                right="{{item.right}}"
                onRightItemClick="onRightItemClick"
                onSwipeStart="onSwipeStart"
                extra="item{{index}}"
            >
        </view>
    </list>
</view>
```

```

<list-item
    arrow="horizontal"
    index="{{index}}"
    key="items-{{index}}"
    onClick="onItemClick"
    last="{{index === list.length - 1}}"
>
    {{item.content}}
</list-item>
</swipe-action>
</view>
</list>
</view>

```

copy

```

// API-DEMO page/component/swiper-action/swiper-action.js
Page({
  data: {
    swipeIndex: null,
    list: [\n      { right: [{ type: 'edit', text: ' Unfavorite ', bgColor: '#ccc', fColor: '#f00' }, { type: 'delete', text: ' Delete ', bgColor: '#0ff', fColor: '#333' }], content: ' Text & background color change at the same time Execute swipe deletion recovery ' },\n      { right: [{ type: 'delete', text: ' Delete ' }], content: 'AAA' },\n      { right: [{ type: 'edit', text: ' Unfavorite ' }, { type: 'delete', text: ' Delete ' }], content: 'BBB' },\n      { right: [{ type: 'delete', text: ' Delete ' }], content: 'CCC' },\n    ],
  },
  onRightItemClick(e) {
    const { type } = e.detail;
    my.confirm({
      title: 'Tips',
      content:
` ${e.index}-${e.extra}-${JSON.stringify(e.detail)} `,
      confirmButtonText: 'Confirm',
      cancelButtonText: 'Cancel',
      success: (result) => {
        const { list } = this.data;
        if (result.confirm) {
          if (type === 'delete') {
            list.splice(this.data.swipeIndex, 1);
            this.setData({
              list: [...list],
            });
          }
        }
        my.showToast({

```

```

        content: 'Confirm => Execute swipe deletion recovery
        ',
        });
        e.done();
    } else {
        my.showToast({
            content: 'Cancel => Swipe deletion status remains
unchanged ',
        });
    }
},
),
},
),
onItemClick(e) {
    my.alert({
        content: `dada${e.index}`,
    });
},
onSwipeStart(e) {
    this.setData({
        swipeIndex: e.index,
    });
},
);

```

Attributes

||||| --- | --- | --- | --- || **Property** | **Description** | **Type** | **Default** || className |
Customized class. | String | - || right | Sliding option, at most two options. |
Array[Object{type: edit/delete, text: string, fColor: 'Color value', bgColor: 'Color value'}] | [] || onRightItemClick | Click sliding option. | ({index, detail, extra, done}) => void |
Call done to fold swipeAction || restore | Restore the component to its initial status.
When there are multiple swipeAction components, to slide one of them, it is required to
set the restore attribute of the others as true, which prevents multiple swipeAction
becomes active on the same page. | Boolean | false || onSwipeStart | Start sliding
callback. | (e: Object) => void | - || extra | Extra information, to get in the
onRightItemClick callback. | any | - |

TabBar FAQ

2021-05-09 18:43

Supported Function FAQ

Q: Does the page of tab bar support redirecting with parameters?

A: Yes, the page of tab bar support jumping with parameters.

Q: Does the location of tab bar support to be set to the top?

A: The location of tab bar does not support custom settings now.

Q: How to monitor tab bar tapping event?

A: You can monitor tab bar tapping event by using `onTabItemTap` in Mini Program.

Q: Does the icon of tab bar support SVG format?

A: SVG format is not supported, only PNG/JPEG/JPG/GIF format are supported.

Q: How to set the style of tab bar?

A: You can set the style of tab bar in the JSON, which is shown as follows. And you can also call `my.setTabBarStyle` to set.

copy

```
"tabBar": {  
    "textColor": "#404040",  
    "selectedColor": "#108ee9",  
    "backgroundColor": "#F5F5F9"  
}
```

Exception Requests FAQ

Q: What to do if "Cannot read property getCurrentPages of undefined" is reported when switching the tab bar?

A: Error path. Please check the path of tab bar.

Q: Why tab bar is not displayed after the page is redirected?

A: If the user enter the page by `my.navigateTo` or `my.redirectTo`, the bottom tab bar is not displayed. The first page of tab bar must be the homepage.

Q: How to obtain the upper page path after entering the page of tab bar?

A: Save the current page path globally when entering the tab bar page, and you can get the upper page path by using the global address when switching tab bar pages.

Tabs

2022-07-03 18:44

Tabs allow the user to switch between different views.

Tabs

	Property	Type	Default	Required	Description
className	String	No	Customized class.		Customized class for activating tabBar.
tabs	Array	Yes	tab data, including the tab title.	Badge text badgeText takes effect when the badgeType is text.	The badge type badgeType includes dot and text, and is not displayed if the badgeType is not set.
activeCIs	String			activeTab	Number
showPlus	Boolean	false			Index of the currently active tab.
onPlusClick	() => {}	No		Callback	when the “+” icon or not.
onTabClick	(index: Number) => void	No		Callback	when the tab is clicked.
onChange	(index: Number) => void	No		Triggered	when tab changes.
swipeable	Boolean	true	No	If it is possible to switch contents by swiping.	Duration
duration	Number	500(ms)	No	Duration of wiping animation in ms,	when the swipeable is true.
tabBarBackgroundColor	String	No		tabBar background color.	
tabBarActiveTextColor	String	No		Active Tab text color of the tabBar.	
tabBarInactiveTextColor	String	No		Inactive Tab text color of the tabBar.	
tabBarUnderlineColor	String	No		tabBar underline color.	tabBarCls
tabBarCls	String	No		tabBar custom style class.	

Tab-content

View content

	Property	Description	Type	index	Unique index of list item.
			String		

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "tabs": "mini-antui/es/tabs/index",
    "tab-content": "mini-antui/es/tabs/tab-content/index"
  }
}
```

copy

```
<view>
  <tabs
    tabs="{{tabs}}"
    showPlus="{{true}}"
    onTabClick="handleTabClick"
    onChange="handleTabChange"
    onPlusClick="handlePlusClick"
```

```
    activeTab="{{activeTab}}"  
>  
    <block a:for="{{tabs}}>  
      <tab-content key="{{index}}>  
        <view class="tab-content">content of {{item.title}}</view>  
      </tab-content>  
    </block>  
  </tabs>  
</view>
```

copy

```
Page({  
  data: {  
    tabs: [\n      {\n        title: 'Option',\n        badgeType: 'text',\n        badgeText: '6',\n      },\n      {\n        title: 'Option two',\n        badgeType: 'dot',\n      },\n      { title: '3 Tab' },\n      { title: '4 Tab' },\n      { title: '5 Tab' },\n    ],\n    activeTab: 2,  
,  
  handleTabClick({ index }) {  
    this.setData({  
      activeTab: index,  
    });  
,  
  handleTabChange({ index }) {  
    this.setData({  
      activeTab: index,  
    });  
,  
  handlePlusClick() {  
    my.alert({  
      content: 'plus clicked',  
    });  
,  
  );  
});
```

copy

```
.tab-content {  
  display: flex;  
  justify-content: center;
```

```
    align-items: center;
    height: 300px;
}
```

Tag

2022-07-03 18:44

You can use the tag component to highlight the information, such as the warning.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "Tag",
  "usingComponents": {
    "tag": "mini-ali-ui/es/tag/index",
    "list-item": "mini-ali-ui/es/list/list-item/index",
    "am-switch": "mini-ali-ui/es/am-switch/index"
  }
}
```

.axml

copy

```
<view style="padding: 12px;">

  <view style="display: flex; justify-content: space-evenly;">

    <tag size="lg" iconType="{{useIcon ? 'qr' : ''}}" ghost="
```

```
  {{ghost}}" type="primary">tag</tag>

    <tag size="lg" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="warning">tag</tag>

    <tag size="lg" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="danger">tag</tag>

    <tag size="lg" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="success">tag</tag>

</view>

<view style="display: flex; justify-content: space-evenly; margin-top: 20px;">

  <tag size="sm" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="primary">tag</tag>

  <tag size="sm" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="warning">tag</tag>

  <tag size="sm" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="danger">tag</tag>

  <tag size="sm" iconType="{{useIcon ? 'qr' : ''}}" ghost="{{ghost}}" type="success">tag</tag>

</view>

<view style="padding: 20px 10px;">

  <list-item>

    icon

    <am-switch slot="extra" onChange="setInfo" data-name="useIcon" checked="{{useIcon}}"/>

  </list-item>

  <list-item>

    the style of the wireframe

    <am-switch slot="extra" onChange="setInfo" data-name="ghost" checked="{{ghost}}"/>

  </list-item>

</view>
```

```
</view>
```

.js

copy

```
Page({  
  data: {},  
  onLoad() {},  
  setInfo(e) {  
    const { dataset } = e.target;  
    const { name } = dataset;  
    this.setData({  
      [name]: e.detail.value,  
    });  
  },  
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || className | String | Class name. || type | String | Tag type. Valid values are:

- **primary**
- **success**
- **warning**
- **danger**

The default value is **primary**. || iconType | String | Icon type. The icon is a thumbnail image in the tag. || size | String | Tag size. Valid values are:

- **lg**: large
- **sm**: small

The default value is **lg**. || ghost | Boolean | An indicator of whether the tag has a frame. The default value is **false**. |

slot

||||| --- | --- || **Name** | **Description** || extra | The slot that is used to display texts in the tag. |

Template {#template}

Last updated: 2022-07-03

Path: miniprogram_gcash

Template

2022-07-03 18:44

The axml provides `template`, where the code snippet can be defined for invoking elsewhere.

It is recommended to use `template` to introduce template snippet because `template` specifies the action scope and uses only the data imported. If the data in the template does not change, the UI of the snippet will not be re-rendered.

Define Template

Use the `name` attribute to declare template name and then define code snippet within `<template/>`.

copy

```
<!--
  index: int
  msg: string
  time: string
-->
<template name="msgItem">
  <view>
    <text> {{index}}: {{msg}} </text>
    <text> Time: {{time}} </text>
  </view>
</template>
```

Use Template

Use the `is` attribute to declare the required template and then introduce the required `data`. For example:

copy

```
<template is="msgItem" data="{{...item}}"/>
```

copy

```
Page({
  data: {
    item: {
      index: 0,
      msg: 'this is a template',
      time: '2019-04-19',
    },
  },
});
```

The `is` attribute allows using the Mustache syntax to decide dynamically which template to render.

copy

```
<template name="odd">
  <view> odd </view>
</template>
<template name="even">
  <view> even </view>
</template>

<block a:for="{{[1, 2, 3, 4, 5]}}">
  <template is="{{item % 2 == 0 ? 'even' : 'odd'}}"/>
</block>
```

Template Action Scope

The template has an action scope and can use the data introduced by "data". Except for the data directly introduced by "data", it is possible to use the `onXX` event to bind page logic for function handling. Below are the sample codes:

copy

```
<!-- templ.axml -->
<template name="msgItem">
  <view>
    <view>
      <text> {{index}}: {{msg}} </text>
      <text> Time: {{time}} </text>
    </view>
    <button onTap="onClickButton">onTap</button>
  </view>
</template>
```

copy

```
<!-- index.axml -->
<import src=".templ.axml"/>
<template is="msgItem" data="{{...item}}"/>

copy

Page({
  data: {
    item: {
      index: 0,
      msg: 'this is a template',
      time: '2019-04-22'
    }
  },
  onClickButton(e) {
    console.log('button clicked', e)
  },
});
```

Path: miniprogram_gcash

Template

2021-05-09 18:43

The axml provides `template`, where the code snippet can be defined for invoking elsewhere.

It is recommended to use `template` to introduce `template` snippet because `template` specifies the action scope and uses only the `data` imported. If the `data` in the `template` does not change, the UI of the snippet will not be re-rendered.

Define Template

Use the `name` attribute to declare template name and then define code snippet within `<template/>`.

copy

```
<!--
  index: int
  msg: string
  time: string
-->
<template name="msgItem">
  <view>
    <text> {{index}}: {{msg}} </text>
    <text> Time: {{time}} </text>
  </view>
</template>
```

Use Template

Use the **is** attribute to declare the required template and then introduce the required **data**. For example:

copy

```
<template is="msgItem" data="{{...item}}"/>
```

copy

```
Page({
  data: {
    item: {
      index: 0,
      msg: 'this is a template',
      time: '2019-04-19',
    },
  },
});
```

The **is** attribute allows using the Mustache syntax to decide dynamically which template to render.

copy

```
<template name="odd">
  <view> odd </view>
</template>
<template name="even">
  <view> even </view>
</template>

<block a:for="{{[1, 2, 3, 4, 5]}}">
  <template is="{{item % 2 == 0 ? 'even' : 'odd'}}"/>
</block>
```

Template Action Scope

The template has an action scope and can use the data introduced by "data". Except for the data directly introduced by "data", it is possible to use the onXX event to bind page logic for function handling. Below are the sample codes:

copy

```
<!-- templ.axml -->
<template name="msgItem">
    <view>
        <view>
            <text> {{index}}: {{msg}} </text>
            <text> Time: {{time}} </text>
        </view>
        <button onTap="onClickButton">onTap</button>
    </view>
</template>
```

copy

```
<!-- index.axml -->
<import src=".//templ.axml"/>
<template is="msgItem" data="{{...item}}"/>
```

copy

```
Page({
  data: {
    item: {
      index: 0,
      msg: 'this is a template',
      time: '2019-04-22'
    }
  },
  onClickButton(e) {
    console.log('button clicked', e)
  },
});
```

Template and Style {#template-and-style}

Last updated: 2022-07-03

Path: miniprogram_gcash

Template and Style

2022-07-03 18:44

Similar to page, custom component has its own axml template and acss style.

axml

The axml is the mandate part of custom component.

Note:

Different from page, user's customized event shall be placed in methods.

Example:

copy

```
<!-- /components/xx/index.axml -->
<view onTap="onMyClick" id="c-{{$id}}"/>
```

copy

```
Component({
  methods: {
    onMyClick(e) {
      console.log(this.is, this.$id);
    },
  },
});
```

slot

By supporting props in component js, the custom component can interact with external caller, accepting the data transferred from the external caller, calling the function transferred from the external caller, and notifying the internal change of the component to the external caller.

However, this is not enough, because the custom component is not flexible enough. In addition to data processing and notification, the Mini Program provides slot, so that the custom component axml structure can be assembled by using the axml transferred from the external caller. The external caller can transfer axml to custom component, which the custom component uses to assemble the final component axml structure.

Default slot

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
  </slot>
  <view>other</view>
</view>
```

Caller does not transfer axml

copy

```
<!-- /pages/index/index.axml -->
<xx />
```

Page output:

copy

```
default slot & default value
other
```

Caller transfers axml

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view>xx</view>
  <view>yy</view>
</xx>
```

Page output:

copy

```
xx
yy
other
```

The “slot” can be interpreted as the slot. The “default slot” is the default slot. If the caller does not transfer axml in the component tag , the default slot is rendered. If the caller transfers axml in the component tag , it is used to replace the default slot and assemble the final axml for render.

Named slot

The default slot can transfer one set of axml. For complicated component, it is required to render different axml at different locations, that is, to transfer multiple axml. Here it needs named slot .

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
  </slot>
  <slot name="header"/>
  <view>body</view>
  <slot name="footer"/>
</view>
```

Transfer only named slot

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view slot="header">header</view>
  <view slot="footer">footer</view>
</xx>
```

Page output

copy

```
default slot & default value
header
body
footer
```

Transfer named slot and default slot

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view>this is to default slot</view>
  <view slot="header">header</view>
  <view slot="footer">footer</view>
</xx>
```

Page output

copy

```
this is to default slot
header
body
footer
```

The named slot is the slot with a name. In the sub-tag of the custom component tag, the external caller can specify which part of axml to place in which named slot of the custom component. The part without named slot specified in the sub-tag of the custom component tag is placed into the default slot. If it transfers only the named slot, the default slot will not be overwritten.

slot-scope

Through the named slot, the custom component axml uses either the custom component axml, or the external caller (such as page) axml.

By using the custom component axml, it is possible to access the data within the component. Through the props attribute, meanwhile, it is possible to access the data of external caller.

Example:

copy

```
// /components/xx/index.js
Component({
  data: {
    x: 1,
  },
  props: {
    y: '',
  },
});
```

copy

```
<!-- /components/xx/index.axml -->
<view>component data: {{x}}</view>
<view>page data: {{y}}</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});
```

copy

```
<!-- /pages/index/index.axml -->
<xx y="{{y}}"/>
```

Page output:

copy

```
component data: 1
page data: 2
```

When the custom component uses external caller (such as page) axml through slot, it can access the data of external caller only.

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
  </slot>
  <view>body</view>
</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});
```

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view>page data: {{y}}</view>
</xx>
```

Page output:

copy

page data: 2

The slot scope allows the slot content can access the data within the component.

Sample code:

copy

```
// /components/xx/index.js
Component({
  data: {
    x: 1,
  },
});
```

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot x="{{x}}">
    <view>default slot & default value</view>
  </slot>
  <view>body</view>
</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});

copy

<!-- /pages/index/index.axml -->
<xx>
  <view slot-scope="props">
    <view>component data: {{props.x}}</view>
    <view>page data: {{y}}</view>
  </view>
</xx>
```

Page output:

copy

```
component data: 1
page data: 2
body
```

As shown above, the custom component exposes the internal component data by defining the slot attribute. When the page uses the component, the action scope slot is declared via slot-scope. The attribute value defines the temporary variable name props, thus accessible to the internal data of the component.

acss

Just like the page, the custom component can have its defined own acss style. The acss is automatically introduced into the page that uses the component without manual introduction of the page.

Template and Style

2021-05-09 18:43

Similar to page, custom component has its own axml template and acss style.

axml

The axml is the mandate part of custom component.

Note:

Different from page, user's customized event shall be placed in methods.

Example:

copy

```
<!-- /components/xx/index.axml -->
<view onTap="onMyClick" id="c-{{$id}}"/>
```

copy

```
Component({
  methods: {
    onMyClick(e) {
      console.log(this.is, this.$id);
    },
  },
});
```

slot

By supporting props in component js, the custom component can interact with external caller, accepting the data transferred from the external caller, calling the function transferred from the external caller, and notifying the internal change of the component to the external caller.

However, this is not enough, because the custom component is not flexible enough. In addition to data processing and notification, the Mini Program provides slot, so that the custom component axml structure can be assembled by using the axml transferred from the external caller. The external caller can transfer axml to custom component, which the custom component uses to assemble the final component axml structure.

Default slot

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
  </slot>
</view>
```

```
<view>other</view>
</view>
```

Caller does not transfer axml

copy

```
<!-- /pages/index/index.axml -->
<xx />
```

Page output:

copy

```
default slot & default value
other
```

Caller transfers axml

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view>xx</view>
  <view>yy</view>
</xx>
```

Page output:

copy

```
xx
yy
other
```

The “slot” can be interpreted as the slot. The “default slot” is the default slot. If the caller does not transfer axml in the component tag , the default slot is rendered. If the caller transfers axml in the component tag , it is used to replace the default slot and assemble the final axml for render.

Named slot

The default slot can transfer one set of axml. For complicated component, it is required to render different axml at different locations, that is, to transfer multiple axml. Here it needs named slot .

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
```

```

</slot>
<slot name="header"/>
<view>body</view>
<slot name="footer"/>
</view>

```

Transfer only named slot

copy

```

<!-- /pages/index/index.axml -->
<xx>
    <view slot="header">header</view>
    <view slot="footer">footer</view>
</xx>

```

Page output

copy

```

default slot & default value
header
body
footer

```

Transfer named slot and default slot

copy

```

<!-- /pages/index/index.axml -->
<xx>
    <view>this is to default slot</view>
    <view slot="header">header</view>
    <view slot="footer">footer</view>
</xx>

```

Page output

copy

```

this is to default slot
header
body
footer

```

The named slot is the slot with a name. In the sub-tag of the custom component tag, the external caller can specify which part of axml to place in which named slot of the custom component. The part without named slot specified in the sub-tag of the custom component tag is placed into the default slot. If it transfers only the named slot, the default slot will not be overwritten.

slot-scope

Through the named slot, the custom component axml uses either the custom component axml, or the external caller (such as page) axml.

By using the custom component axml, it is possible to access the data within the component. Through the props attribute, meanwhile, it is possible to access the data of external caller.

Example:

copy

```
// /components/xx/index.js
Component({
  data: {
    x: 1,
  },
  props: {
    y: '',
  },
});
```

copy

```
<!-- /components/xx/index.axml -->
<view>component data: {{x}}</view>
<view>page data: {{y}}</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});
```

copy

```
<!-- /pages/index/index.axml -->
<xx y="{{y}}"/>
```

Page output:

copy

```
component data: 1
page data: 2
```

When the custom component uses external caller (such as page) axml through slot, it can access the data of external caller only.

Sample code:

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot>
    <view>default slot & default value</view>
  </slot>
  <view>body</view>
</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});
```

copy

```
<!-- /pages/index/index.axml -->
<xx>
  <view>page data: {{y}}</view>
</xx>
```

Page output:

copy

page data: 2

The slot scope allows the slot content can access the data within the component.

Sample code:

copy

```
// /components/xx/index.js
Component({
  data: {
    x: 1,
  },
});
```

copy

```
<!-- /components/xx/index.axml -->
<view>
  <slot x="{{x}}">
    <view>default slot & default value</view>
  </slot>
  <view>body</view>
</view>
```

copy

```
// /pages/index/index.js
Page({
  data: { y: 2 },
});

copy

<!-- /pages/index/index.axml -->
<xx>
  <view slot-scope="props">
    <view>component data: {{props.x}}</view>
    <view>page data: {{y}}</view>
  </view>
</xx>
```

Page output:

copy

```
component data: 1
page data: 2
body
```

As shown above, the custom component exposes the internal component data by defining the slot attribute. When the page uses the component, the action scope slot is declared via slot-scope. The attribute value defines the temporary variable name props, thus accessible to the internal data of the component.

acss

Just like the page, the custom component can have its defined own acss style. The acss is automatically introduced into the page that uses the component without manual introduction of the page.

Terms {#terms}

Last updated: 2022-07-03

Path: miniprogram_gcash

Terms

2022-07-03 18:44

You can use the terms component when users must agree with terms before using or activating the service. Normally a link to the terms is provided for user's reference.

Sample code

See the sample codes in different languages:

.json

copy

```
{  
  "defaultTitle": "Terms",  
  "usingComponents": {  
    "terms": "mini-ali-ui/es/terms/index"  
  }  
}
```

.axml

copy

```
<view>  
  <terms onSelect="onSelect" related="{{c1.related}}" hasDesc="{{c1.hasDesc}}" agreeBtn="{{c1.agreeBtn}}" cancelBtn="{{c1.cancelBtn}}>  
    <view class="text" slot="header">  
      <text>  
        Agree  
        <navigator class="link" url="https://example.com">user  
        authorization terms</navigator>  
      </text>  
    </view>  
  </terms>  
  <text class="title">double button</text>  
</view>  
<view>  
  <terms onSelect="onSelect" fixed="{{c2.fixed}}" related="{{c2.related}}" hasDesc="{{c2.hasDesc}}" agreeBtn="{{c2.agreeBtn}}" cancelBtn="{{c2.cancelBtn}}" shape="{{c2.shape}}" capsuleMinWidth="{{c2.capsuleMinWidth}}" capsuleSize="{{c2.capsuleSize}}>  
    <view class="text" slot="desc">  
      <text>  
        check  
        <navigator class="link" url="https://example.com">ETC Service  
        User Terms</navigator>  
        Authorize ETC service to obtain ID card and delivery address  
        for ETC application. Pay attention to the owner's service life number  
        for approval  
    </view>  
  </terms>  
</view>
```

```
</text>
</view>
</terms>
<text class="title">Title with additional description</text>
</view>
<view>
<terms onSelect="onSelect" fixed="{{c3.fixed}}" related="{{c3.related}}"
hasDesc="{{c3.hasDesc}}" agreeBtn="{{c3.agreeBtn}}"
cancelBtn="{{c3.cancelBtn}}>
<view class="text" slot="header">
<text>
    agree
    <navigator class="link" url="https://example.com">User
Authorization Terms</navigator>
</text>
</view>

    related: false,
    agreeBtn: {
        title: 'agree the term and open',
    },
    cancelBtn: {
        title: 'Not open temporarily, manual payment',
    },
    hasDesc: false,
},
c2: {
    related: false,
    agreeBtn: {
        title: 'agree the term and open',
    },
    hasDesc: true,
},
c3: {
```

```

        related: true,
        agreeBtn: {
            checked: true,
            title: 'submit',
        },
    },
    c4: {
        related: true,
        agreeBtn: {
            title: 'submit',
        },
    },
    c5: {
        related: false,
        agreeBtn: {
            title: 'agree the term and submit',
        },
    },
    c6: {
        related: true,
        fixed: true,
        agreeBtn: {
            checked: true,
            title: 'submit',
        },
    },
},
};

Page({
    data: cfg,
    onLoad() {
    },
    onSelect(e) {
        const selectedData = e.currentTarget.dataset.name || '';
        selectedData && my.alert({
            title: 'Terms Btns',
            content: selectedData,
        });
    },
});

```

Parameters

||||| --- | --- | --- | | **Property** | **Type** | **Description** | | fixed | Boolean | An indicator of whether to display the terms at the bottom of the page. The default value is `false`. | | related | Boolean | An indicator of whether the user needs to select the checkbox. The default value is `true`. | | agreeBth | Object | The button that users can click to agree with the terms. The default value is `{"title": "", "subtitle": "", "type": "primary", "data": 1, "checked": false}`. | | cancelBtn | Object | The button that users can click to not agree with the terms. The default value is `{"title": "", "subtitle": "", "type": "default", "data": 2}`. | | capsuleSize | String | Capsule button size. Valid

values are:

- `large`
- `medium`
- `small`

The default value is `medium`. || `shape` | String | Button shape. Valid values are:

- `default`
- `capsule`

The default value is `default`. || `capsuleMinWidth` | Boolean | An indicator of whether to use the minimum width for the capsule button. The default value is `false`. || `hasDesc` | Boolean | An indicator of whether to display the description about the terms. The default value is `false`. || `onSelect` | EventHandle | The event that is triggered when users click the agree button. |

Tips {#tips}

Last updated: 2022-07-03

Path: miniprogram_gcash

Tips

2022-07-03 18:44

Tool tips Including two types `tips-dialog` and `tips-plain`.

tips-dialog

Property	Description	Type	Default	Required
<code>className</code>	Custom class.	<code>String</code>	<code>No</code>	<code>show</code> Show control component or not.

Boolean | true | No || type | dialog indicates the style of dialog box, rectangle for rectangle style. | String | dialog | No || onCloseTap | When the type value is rectangle, component clicking close the icon callback. | () => void | No || iconUrl | Show the icon url. | String | No |

Slots

slotName	Description	content	Used to render tip text contents.	operation	Used to render right-hand operation area.
----------	--------------------	---------	-----------------------------------	-----------	---

tips-plain

Property	Description	Type	Default	Required
className	Custom class.	String	No	Automatic close time. (in milliseconds)

Number | 5000(ms) | No | onClose | Callback and close tip box. | () => void | No |

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "tips-dialog": "mini-antui/es/tips/tips-dialog/index",
    "tips-plain": "mini-antui/es/tips/tips-plain/index"
  }
}
```

tips-dialog

copy

```
<view>
  <tips-dialog
    show="{{showDialog}}"
    className="dialog"
    type="dialog"
  >
    <view class="content" slot="content">
      <view>hello,</view>
      <view>Welcome to use the Mini Program extension component
library</view>
    </view>
    <view slot="operation" class="opt-button"
onTap="onDialogTap">OK</view>
  </tips-dialog>
  <tips-dialog
    iconUrl="https://img.example.com/example.png"
    type="rectangle"
    className="rectangle"
    onCloseTap="onCloseTap"
    show="{{showRectangle}}"
  >
    <view class="content" slot="content">
      Add to home page
    </view>
  </tips-dialog>
</view>
```

```
</view>
<view slot="operation" class="add-home" onTap="onRectangleTap">Add
it now</view>
</tips-dialog>
</view>
```

copy

```
Page({
  data: {
    showRectangle: true,
    showDialog: true,
  },
  onCloseTap() {
    this.setData({
      showRectangle: false,
    });
  },
  onRectangleTap() {
    my.alert({
      content: 'do something',
    });
  },
  onDialogTap() {
    this.setData({
      showDialog: false,
    });
  },
});
```

copy

```
.rectangle {
  position: fixed;
  bottom: 100px;
}

.dialog {
  position: fixed;
  bottom: 10px;
}

.content {
  font-size: 14px;
  color: #fff;
}

.opt-button {
  width: 51px;
  height: 27px;
  display: flex;
  justify-content: center;
```

```

    align-items: center;
    color: #fff;
    font-size: 12px;
    border: #68BAF7 solid 1rpx;
}

.add-home {
    width: 72px;
    height: 27px;
    display: flex;
    justify-content: center;
    align-items: center;
    background-color: #56ADEB;
    color: #fff;
    font-size: 14px;
}

```

tips-plain

copy

```
<tips-plain onClose="onClose" time="{{time}}">{{content}}</tips-plain>
```

copy

```
Page({
  data: {
    content: 'OK',
    time: 2000,
  },
  onClose() {
    my.alert({
      title: '12321'
    });
  }
});
```

Title {#title}

Last updated: 2022-07-03

Path: miniprogram_gcash

Title

2022-07-03 18:44

You can use the title component to display the title of each page.

Sample code

See the sample codes in different languages:

.json

copy

```
{  
  "defaultTitle": "title",  
  "usingComponents": {  
    "title": "mini-ali-ui/es/title/index"  
  }  
}
```

.axml

copy

```
<title  
  hasLine="true"  
  type="more"  
  onActionTap="titleMore"  
>Title without icon</title>  
<title  
  hasLine="true"  
  iconURL="https://example.com/images/T1HHFgXXVeXXXXXXXXX.png"  
  type="close"  
  onActionTap="titleClose"  
>Title with a close action</title>  
<title  
  hasLine="true"  
  className="changeColor"  
  
  iconURL="https://example.com/mdn/miniprogram_mendian/afts/img/A*wiFYTo!  
  type="arrow"  
  onActionTap="titleGo"  
>Modify the style by class</title>
```

.acss

copy

```
.changeColor {  
  font-size: 30px;
```

```
color: #f32600;
}
```

.js

copy

```
Page({
  data: {},
  onLoad() {},
  titleGo() {
    my.showToast({
      content: 'click the arrow to jump',
    });
  },
  titleMore() {
    my.showToast({
      content: 'click the more to display bubble menu',
    });
  },
  titleClose() {
    my.showToast({
      content: 'click the close to close',
    });
  },
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || className | String | Customized class. || hasLine | Boolean | An indicator of whether a line is required under the title. The default value is `false`. || iconURL | String | URL of the icon next to title name. The icon is displayed as a square image by default. || type | String | Type of the icon that users can tap. Valid values are:

- `arrow`
- `close`
- `more`
- `custom`: The customized content is empty by default and you need to specify the slot that is named *operation*.

This property is null by default. When the property is null, `onActionTap` is invalid. || `onActionTap` | EventHandle | The event that is triggered when users tap the icon on the right of title. The default value is `() => {}`. The event is valid only when `type` is specified. |

Tool Bar {#tool-bar}

Last updated: 2021-05-09

Path: miniprogram_gcash

Tool Bar

2021-05-09 18:43

The tool bar of the Mini Program Studio locates in the top of the software. It contains the core function of the Mini Program Studio.

You can see the descriptions for each option in the toolbar from the left to right.

Associate Mini Program

One developer account can have multiple Mini Programs. After the account login, developers are required to associate the Mini Program under development. Associated application decides which code package will be uploaded to which Mini Program when you click to upload the codes.

Toggle Display Area

The middle of the tool bar can control whether display the coding area, devtools view and simulator.

Note: the function panel will display or dismiss together with coding area. The coding area and devtools can not be hidden at the same time.

Compiling Mode

By default it is in normal compiling mode. In other words, the default refresh simulator will open the home page and not pass in any parameter. You may add custom compiling mode so that it starts from another page upon the simulator refresh with related parameters, which will increase debugging efficiency.

By clicking the `Compile` selector and then click the `New` option, you can create a new compiling mode.

Clear Cache

Clear the build cache and network cache.

Remote Debugging with Real Machine

During the real machine debugging, it is possible to view the debugging information in Mini Program Studio, and you can also set breakpoint, check runtime logs. For details see [Remote Debugging](#).

Preview with Real Machine

Use app to scan the QR code and preview the Mini Program in the app of real machine. The QR code will be invalid after 15 minutes.

Upload

On basis of the associated Mini Program, the Mini Program codes are uploaded to the Mini Program Developer Portal to build an executable program in app. The uploaded version can be specified, if not specified, the current version is incremented by 1(the current version must be greater than the previous version). After the upload is completed, a unique development version is generated in the Mini Program Developer Portal.

For the version management standard and specifications, see [Semver](#).

Details

Click the Details button in the tool bar, the details window will display in the editor area.

The details mainly contains following information:

- The associated Mini Program name, local project path and online version of the Mini Program.
- Modify the project configuration
- Enable component2 compile: it needs to be enabled for custom component, see details [here](#).
- Enable Axml strict check: it will check the grammar of the axml file in strict mode, which can help to improve the quality of the code.
- Enable parallel loader: it will use multiple processes to build the project to make it faster.
- Enable distFile minify: minify the source code. By default, in preview and debug mode, the code is not minified. In production, it will always be minified.
- Ignore the domain check for request API such as `my.request`, `my.uploadFile` in simulation, preview and debug mode.
- Ignore the domain check for web-view component in simulation, preview and debug mode.

Login

If you have not login to the Mini Program Studio, click the Login button to login.

After login, click the avatar, you can choose to logout the Mini Program Studio. If you exit the Mini Program Studio after logout, next time when you re-open the Mini Program Studio, login is required.

Try Mini Program Demo

2022-07-03 18:44

Download Mini Program Studio

Firstly, please download Mini Program Studio. It is a desktop application that helps the development of Mini Program, including local debugging, code editing, preview on device, publish and other functions that cover the whole workflow of Mini Program development.

Try Your First Mini Program

Open the IDE and click '+' to add new project.

Input the Mini Program name and select the project path, then click 'Complete' to open the project.

Preview your first Mini Program in the editor.

Now you have completed the creation of your first Mini Program project in local. Next, start your journey in the editor at the right side.

The following contents introduce in steps how to develop the demo, and get you through the basic development workflow through the demo. After the development, refer the [release flow](#) to publish the Mini Program.

Two-factor authentication {#two-factor-authentication}

Last updated: 2022-07-07

Path: miniprogram_gcash

Two-factor authentication

2022-07-07 17:08

What's two-factor authentication?

Two-factor authentication (2FA) is an authentication method that requires two factors to verify a user's identity. Users are required to provide authentication via these following ways:

- Something you know, such as your username and password.
- Something you have, such as your mobile device.

As two types of authentication is required, the 2FA feature safeguards your account even if your password has been leaked. This extra layer of security also protects your account from malicious attacks and data breaches. The Mini Program platform provides the 2FA feature via the Google Authenticator.

Procedures

You can set the 2FA under **Settings > Two-Factor Authentication**. See the procedures below on how to enable and disable 2FA:

Enable the two-factor authentication

To enable the 2FA, complete the following steps:

1. Go to **Settings > Two-Factor Authentication** and click **Activate**.

2. Download the Google Authenticator app on your mobile device.
3. Use the Google Authenticator app to scan the QR code displayed on the Mini Program Platform. If you are not able to scan the QR code, click on **Enter a text code** and the Mini Program platform will generate a time-based key which you can enter into the app.
4. The Google Authenticator app will generate a 6-digit verification code, which you need to enter into the Mini Program platform.

Note:

If you have changed your mobile device or are not able to access it, you need to disable the 2FA and set it up again on a new device.

Disable the two-factor authentication

You can disable the 2FA any time after it's enabled. To disable the 2FA, complete the following steps:

1. Go to **Settings > Two-Factor Authentication** and click **Disable**.
2. The Mini Program platform will send a verification code to your account email.
3. Enter the verification code in the Mini Program platform and confirm to disable the 2FA.

Understand the Mini Program File Structure {#understand-the-mini-program-file-structure}

Last updated: 2022-07-03

Path: miniprogram_gcash

Understand the Mini Program File Structure

2022-07-03 18:44

Overview

This section uses Todo program demo as an example to introduce the file structure of Mini Program and the role of each file type in the Mini Program.

Directory Structure

Let's know about the overall directory structure of Mini Program from the following notes

copy

```
assets          // Store various static resources, such as images
components      // Custom component directory of Mini Program
  --add-button // Here we defined a component called add-button
pages          // All pages included in the Mini Program are placed
under "pages", one folder per page
  --add-todo   // Mini Program page
  --Todos     // Mini Program page
app.js         // Here some global service logic is configured for
the Mini Program, such as global method and global variables
app.acss        // Global style configuration, here the styles take
effect on every page
app.json        // Some basic configuration info for the Mini Program
pages, such as page path
```

json

The json file is used to setup Mini Program configuration. For example, the `app.json` includes the related configuration of the whole Mini Program.

copy

```
// app.json

{
  "pages": [
    "pages/todos/todos",
    "pages/add-todo/add-todo"
  ],
  "window": {
    "defaultTitle": "Todo App",
    "titleBarColor": "#323239"
  }
}
```

1. The `pages` attribute is an array. Each string in the array defines the page path of the Mini Program. In the demo of todo list, two directories are configured externally. It is required to add these page configuration after you adding some pages.

2. The defaultTitle configuration in the window defines the title in the navigation bar of the Mini Program: "Todo App". The titleBarColor specifies the navigation bar's background color as hexadecimal color value.

For other configurations of the app.json file, click [here](#).

The above-mentioned json file includes the global json configurations. Each page or component has related json configuration to specify the component dependence and so on. [Click here](#).

axml

Generally, the axml can be regarded as the html of the Mini Program, which differs from the html in terms of:

1. Different tags. For example, Mini Program uses `<view>` to replace `<div>`.
2. The types of tags supported by axml are fewer than html.
3. The axml tag has its own parsing syntax to realize traverse, conditional judgment and other advanced operations. The html only includes static tags.

[copy](#)

```
<view class="todo-item {{completed ? 'checked' : ''}}">
  {{number}}
</view>
```

In axml, the format like `{{ }}` is used to render variables or execute simple operation. For example, the “completed” above is a ternary operation. When the “completed” is true, the class is rendered as “todo-item checked” or just “todo-item”.

The `{{number}}` variable shows the results accordingly after rendering as per the assignment.

acss

The acss extends the css capability while supporting most of the css syntax. In contrast to css, the major differences are:

1. Supporting rpx unit calculation
2. Import acss in other path using `@import`
3. For more details, click [here](#).

js

The js file is used to describe the code logic. Each page needs a js file to describe the logic of the current page. The following codes are used for the illustration simply.

copy

```
// pages/todos/todo.js
const app = getApp();
Page({
  data: {},
  onLoad() {},
  onTodoChanged(e) {}
});
```

The Page class is the constructor of the page, and should be written during the lifecycle of each page.

1. data

- The data object is considered as the axml rendering context. Simply put, if the data has a name with attribute 'Mini Program', the corresponding axml file can use the form {{name}} to read 'Mini Program'. When the setData method is used to make change in "data", the data in axml changes in real time.

2. onLoad

- When this page is initialized at the first time by the user, this function is called.

3. onTodoChanged (user customized function)

- This is a user-customized method. The user can defines more custom functions to implement more capabilities.

In the above contents we have known about the function of each file type in the Mini Program. Next, we will explain Todo App demo in details.

UpdateManager Overview {#updatemanager-overview}

Last updated: 2022-07-03

Path: miniprogram_gcash

UpdateManager Overview

2022-07-03 18:44

The UpdateManager object is used to manage the mini program updates. Call my.getUpdateManager to obtain an UpdateManager instance.

Methods

||||---|---|| **Name** | **Description** || UpdateManager.applyUpdate | Force to restart the mini program and update to the latest version. This API is called after the `onUpdateReady` callback is received, which means that the new version of the mini program is downloaded. || UpdateManager.onCheckForUpdate | Listen for the event that a request is sent to the server to check for updates. || UpdateManager.onUpdateReady | Listen for the event that a newer mini program version is available. || UpdateManager.onUpdateFailed | Listen for the event that the mini program update is failed. |

Sample code

copy

```
const updateManager = my.getUpdateManager()

updateManager.onCheckForUpdate(function (res) {
    // Callback of onCheckForUpdate
    console.log(res.hasUpdate)
})

updateManager.onUpdateReady(function () {
    my.confirm({
        title: 'Update reminder',
        content: 'The new version is ready. Do you want to restart the mini program?',
        success: function (res) {
            if (res.confirm) {
                // The new version is downloaded. Call UpdateManager.applyUpdate to restart and apply the new version.
                updateManager.applyUpdate()
            }
        }
    })
}

updateManager.onUpdateFailed(function () {
    // The new version of the mini program is failed to be downloaded.
})
```

UpdateManager.applyUpdate

2022-07-03 18:44

Force to restart the mini program and update to the latest version. This API is called after the `onUpdateReady` callback is received, which means that the new version of the mini program is downloaded.

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_update_updatemanager_applyupdate

UpdateManager.onCheckForUpdate {#updatemanageroncheckforupdate}

Last updated: 2022-07-03

Path: miniprogram_gcash

UpdateManager.onCheckForUpdate

2022-07-03 18:44

Listen for the event that a request is sent to the server to check for updates. Instead of being triggered actively by the developer, checking the version update is triggered automatically during the mini program cold start.

Parameter

The parameter is in object type and has the following property:

Property	Type	Required	Description	hasUpdate
Boolean	Yes		An indicator of whether a new version is available.	

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_update_updatemanager_checkupdate

UpdateManager.onUpdateFailed {#updatemanageronupdatefailed}

Last updated: 2022-07-03

Path: miniprogram_gcash

UpdateManager.onUpdateFailed

2022-07-03 18:44

Listen for the event that the mini program update is failed. Instead of being triggered by the developer, the client side triggers the new version downloading actively. A callback is performed when the new version of the mini program is failed to be downloaded. The failure might be caused by the network issue.

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_update_updatemanager_updatefail

UpdateManager.onUpdateReady {#updatemanageronupdateready}

Last updated: 2022-07-03

Path: miniprogram_gcash

UpdateManager.onUpdateReady

2022-07-03 18:44

Listen for the event that a newer mini program version is available. Instead of being triggered by the developer, the client side triggers the new version downloading actively. A callback is performed after the new version of the mini program is successfully downloaded.

Upload {#upload}

Last updated: 2022-07-03

Path: miniprogram_gcash

Upload

2022-07-03 18:44

After you complete the development and testing on the simulator or a real machine, the next step is to submit the Mini Program to your workspace in the Mini Program Development Portal and proceed with the subsequent operation to release the Mini Program to users.

In the Mini Program Studio, the one-key upload function is provided:

Before uploading, pay attention to the following points:

1. Firstly, you need to associate the project to a created Mini Program.
2. Online version or current uploaded version: For easy management, each upload has an incremental version. You can define your own versioning rule.

Next, click **Upload**. As the volume of the Mini Program should not exceeds 2048 KB, if it is above the volume limit, a prompt will be displayed. We suggest you to reduce resources to reduce the volume.

Upload mini programs

2022-11-13 15:01

This topic describes the steps of the task to upload a mini program. Developers develop the mini program in the Mini Program Studio (IDE) and upload it to the Mini Program Platform.

Procedures

To upload a version for a mini program, you can view the corresponding steps as follow:

Step 1: Download the IDE

Open the [Mini Program Platform portal](#) and click **Resources** to download the IDE.

Once IDE is up and running, enter the account and password that you registered on Mini Program Platform to log in to IDE.

Step 2: Upload a version

Click **Mini program** on the left navigation panel and select the Todos template. After that click **Next** to continue.

Enter the name of the mini program that was newly created in the workspace.

Click **Upload** to upload the version to the workspace.

Now you have completed uploading a version for a mini program.

Next steps

[Configure mini programs](#)

[Release mini programs](#)

[Generate QR code](#)

[Remove mini programs](#)

Use Custom Component {#use-custom-component}

Last updated: 2021-05-09

Path: miniprogram_gcash

Use Custom Component

2021-05-09 18:43

Use Custom Component

Note:

The event of custom component (such as onTap) is not supported by every custom component by default. It cannot be used unless the custom component itself supports clearly. For details on custom component support event, see the section of component constructor.

The use of custom component is similar to the basic component.

1. In the page json file, specify the custom component to be used.

copy

```
// /pages/index/index.json
{
  "usingComponents": {
    "customer": "/components/customer/index"
  }
}
```

2. In the page axml file, use the custom component, which is similar to the basic components.

copy

```
<!-- /pages/index/index.axml -->
<view>
  <customer />
</view>
```

Citing Custom Component:

copy

```
// page.json Note that it is not configured in app.json
{
  "usingComponents": {
    "your-custom-component": "mini-antui/es/list/index",
    "your-custom-component2": "/components/card/index",
    "your-custom-component3": "./result/index",
    "your-custom-component4": "../result/index"
  }
}
// The project absolute path starts with /; the relative path starts
// with ./ or ../; the npm path does not start with /
```

Reference Information

For installing the npm module, see [framework overview npm part](#)

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/framework_custom-component_use-custom-component

Use Custom Component {#use-custom-component}

Use OrderStr to pay {#use-orderstr-to-pay}

Last updated: 2022-07-03

Path: miniprogram_gcash

Use OrderStr to pay

2022-07-03 18:44

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the [my.tradePay API](#) with `orderStr`. The following two payment types are supported:

- [General online payment](#)
- [Pre-authorization payment](#)

General online payment

Users can complete a general online payment in the mini program.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and creates an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button to make the payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the `my.tradePay` API to initiate a payment in the mini program, mini program developers must complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by `orderStr` and obtain the integration guide from the wallet app.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program Platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment services in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

Figure 1. Process flow of the general payment

The payment process contains the following steps:

1. The user places an order in the mini program (Step 1).
2. The mini program client sends a request to create the order to the mini program server by calling the `my.request` API (Step 1.1).
3. The mini program server creates the order and returns `orderStr` to the mini program client (Step 1.1.1 & 1.1.2).
4. The mini program client initiates the payment request by calling the `my.tradePay` API with `orderStr` to the wallet app (Step 1.1.2.1).
5. The wallet processes the payment request internally and the wallet app renders the cashier page (Step 1.1.2.1.1 - 1.1.2.1.3).
6. The user confirms the payment and the wallet app displays the payment result (Step 2 - 2.2).

7. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server (Step 2.3).
8. The mini program client displays the payment result (Step 2.3.1).

Note:

The payment flow is for reference and may vary depending on the API implementation of the wallet.

Pre-authorization payment

Pre-authorization payment is a common practice in rental and hotel industries where the user can pre-authorize a payment in advance. Unlike goods with confirmed prices, the price of some services can only be determined when the user has finished using the service. As such, service merchants can use pre-authorization payments to ensure that the order can be paid before providing the service.

Merchants can call the `my.tradePay` API with `orderStr` to initiate a pre-authorization payment request via the mini program. After the user has granted pre-authorization, the funds are captured by the merchant automatically after the service amount is settled.

User experience

To complete a pre-authorization payment, users usually follow the steps below:

1. The user confirms to use the service provided by the mini program.
2. The mini program redirects the user to the pre-authorization page in the wallet app.
3. The user confirms the authorization, then the wallet app redirects the user back to the mini program. The user starts to use the service.
4. After the user has finished using the service and the service fee is confirmed, the funds are deducted by the merchant automatically and the user receives a notification in the wallet app.

Procedures

To use the `my.tradePay` API to complete the pre-authorization in the mini program, mini program developers must complete the following steps:

1. Confirm that the wallet app supports the pre-authorization capability and obtain the integration guide from the wallet.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program Platform, or make sure that the mini program can be published in the wallet app.
4. Provide the service that requires pre-authorization in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the pre-authorization payment process:

Figure 2. Process flow of the pre-authorization payment

The payment process contains the following steps:

1. The user starts to use the service in the mini program (Step 1).
2. The mini program client sends a request to create the order to the mini program server by calling the my_request API (Step 2).
3. The mini program server creates the order and returns `orderStr` to the mini program client (Step 3 & 4).
4. The mini program client initiates the pre-authorization request by calling the my.tradePay API with `orderStr` to the wallet app (Step 1.1.2.1).
5. The wallet processes the pre-authorization request internally and the wallet app renders the pre-authorization page (Step 6 - 8).
6. The user completes the pre-authorization and the wallet app returns the pre-authorization result to the mini program client (Step 10 - 12).
7. The user starts to use the service provided by the mini program. When the user has finished using the service, the mini program client sends the payment request to the mini program server by calling the my_request API (Step 13 - 15).
8. The mini program server sends the payment request by calling the server API provided by the wallet and the wallet server returns the payment result (Step 16 & 17).

Note:

The payment flow is for reference and may vary depending on the API implementation of the wallet.

Sample code

Sample code for the `my.tradePay` API calling is as follows:

copy

```
my.tradePay({
    orderStr:
    'app_id=2018112803019836&biz_content=%7B%22amount%22%3A%220.02%22%2C%2
    05-29+15%3A54%3A35&version=1.0',
    success: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
    fail: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
});
```

Use OrderStr to pay in Mini Program

2021-05-09 18:43

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the `my.tradePay` API with `orderStr`. Two payment types are supported:

- [General online payment](#)
- [Pre-authorization payment](#)

General payment

Users can complete a general online payment in the mini program.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and create an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button for payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the `my.tradePay` API to initiate a payment in the mini program, mini program developers complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by *orderStr* and obtain the integration guide from the wallet app.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment service in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

Figure 1. Process flow of the general payment

The payment process contains the following steps:

1. The user places an order in the mini program. (Step 1)
2. The mini program client sends the create order request to the mini program server by calling the [my.request](#) API. (Step 1.1)
3. The mini program server creates the order and returns *orderStr* to the mini program client. (Step 1.1.1 & 1.1.2)
4. The mini program client initiates the payment request by calling the [my.tradePay](#) API with *orderStr* to the wallet app. (Step 1.1.2.1)
5. The wallet processes the payment request internally and the wallet app renders the cashier page. (Step 1.1.2.1.1 - 1.1.2.1.3)
6. The user confirms the payment and the wallet app displays the payment result. (Step 2 - 2.2)
7. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server. (Step 2.3)
8. The mini program client displays the payment result. (Step 2.3.1)

Note:

The payment flow is for reference and might differ depending on the API implementation of the wallet.

Pre-authorization payment

Pre-authorization payment is a common practice in rental and hotel industries where the user can pre-authorize a payment in advance. Unlike goods with confirmed prices, the price of some services can only be determined when the user has finished using the service. As such, service merchants can use pre-authorization payments to ensure that the order can be paid before providing the service.

Merchants can call the [my.tradePay](#) API with *orderStr* to initiate a pre-authorization payment request via the mini program. After the user has granted pre-authorization, the funds are captured by the merchant automatically after the service amount is settled.

User experience

To complete a pre-authorization payment, users usually follow the steps below:

1. The user confirms to use the service provided by the mini program.
2. The mini program redirects the user to the pre-authorization page in the wallet app.
3. The user confirms the authorization, then the wallet app redirects the user back to the mini program. The user starts to use the service.
4. After the user has finished using the service and the service fee is confirmed, the funds are deducted by the merchant automatically and the user receives a notification in the wallet app.

Procedures

To use the `my.tradePay` API to complete the pre-authorization in the mini program, mini program developers must complete the following steps:

1. Confirm that the wallet app supports the pre-authorization capability and obtain the integration guide from the wallet.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program platform, or make sure that the mini program can be published in the wallet app.
4. Provide the service that requires pre-authorization in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the pre-authorization payment process:

Figure 2. Process flow of the pre-authorization payment

The payment process contains the following steps:

1. The user starts to use the service in the mini program. (Step 1)
2. The mini program client sends the create order request to the mini program server by calling the `my.request` API. (Step 2)
3. The mini program server creates the order and returns `orderStr` to the mini program client. (Step 3 & 4)
4. The mini program client initiates the pre-authorization request by calling the `my.tradePay` API with `orderStr` to the wallet app. (Step 1.1.2.1)
5. The wallet processes the pre-authorization request internally and the wallet app renders the pre-authorization page. (Step 6 - 8)
6. The user completes the pre-authorization and the wallet app returns the pre-authorization result to the mini program client. (Step 10 - 12)
7. The user starts to use the service provided by the mini program. When the user has finished using the service, the mini program client sends the payment request to the mini program server by calling the `my.request` API. (Step 13 - 15)

8. The mini program server sends the payment request by calling the server API provided by the wallet and the wallet server returns the payment result. (Step 16 & 17)

Note:

The payment flow is for reference and might differ depending on the API implementation of the wallet.

Sample code

Sample code for the my.tradePay API calling:

copy

```
my.tradePay({
    orderStr:
    'app_id=2018112803019836&biz_content=%7B%22amount%22%3A%220.02%22%2C%22
    05-29+15%3A54%3A35&version=1.0',
    success: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
    fail: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
});
```

Use PaymentUrl to Pay in Mini Program {#use-paymenturl-to-pay-in-mini-program}

Last updated: 2021-05-09

Path: miniprogram_gcash

Use PaymentUrl to Pay in Mini Program

2021-05-09 18:43

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the my.tradePay API with *paymentUrl*. Both the integration processes for mini program developers and the user experience for users are similar to those of the payment by tradeNo.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and create an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button for payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the *my.tradePay* API to initiate a payment in the mini program, mini program developers must complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by *paymentUrl* and obtain the integration guide from the wallet app.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program Platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment service in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

The payment process contains the following steps:

1. The user places an order in the mini program. (Step 1)
2. The mini program client sends the create order request to the mini program server by calling the my.request API. (Step 2)
3. The mini program server creates the order and sends the request to the wallet server via the server API provided by the wallet. (Step 3 & 4)
4. The wallet server creates the order and generates *paymentUrl*, and returns *paymentUrl* to the mini program server. (Step 5-7)
5. The mini program server returns *paymentUrl* to the mini program client. (Step 8)
6. The mini program client initiates the payment request by calling the my.tradePay API with *paymentUrl* to the wallet app. (Step 9)
7. The wallet app obtains the order information and renders the cashier page. (Step 10-13)

8. The user confirms the payment and the wallet processes the payment request. (Step 14-17)
9. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server. (Step 18 & 19)
10. The mini program client displays the payment result. (Step 20)

Note:

The payment flow is for reference and might differ depending on the API implementation of the wallet.

Sample code

Sample code for the *my.tradePay* API calling with *paymentUrl*:

copy

```
my.tradePay({
    paymentUrl: 'payment url',
    success: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
    fail: function(res) {
        my.alert({
            content: JSON.stringify(res),
        });
    },
});
```

Use PaymentUrl to pay

2022-07-03 18:44

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the my.tradePay API with paymentUrl. Both the integration processes for mini program developers and the user experience for users are similar to those of the payment by tradeNo.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and creates an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button to make the payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the my.tradePay API to initiate a payment in the mini program, mini program developers must complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by paymentUrl and obtain the integration guide from the wallet app.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program Platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment services in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

The payment process contains the following steps:

1. The user places an order in the mini program (Step 1).
2. The mini program client sends a request to create the order to the mini program server by calling the my.request API (Step 2).
3. The mini program server creates the order and sends the request to the wallet server via the server API provided by the wallet (Step 3 & 4).
4. The wallet server creates the order and generates paymentUrl, then returns paymentUrl to the mini program server (Step 5-7).
5. The mini program server returns paymentUrl to the mini program client (Step 8).
6. The mini program client initiates the payment request by calling the my.tradePay API with paymentUrl to the wallet app (Step 9).
7. The wallet app obtains the order information and renders the cashier page (Step 10-13).

8. The user confirms the payment and the wallet processes the payment request (Step 14-17).
9. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server (Step 18 & 19).
10. The mini program client displays the payment result (Step 20).

Note:

The payment flow is for reference and may vary depending on the API implementation of the wallet.

Sample code

Sample code for the `my.tradePay` API calling with `paymentUrl` is as follows:

copy

```
my.tradePay({
  paymentUrl: 'payment url',
  success: function(res) {
    my.alert({
      content: JSON.stringify(res),
    });
  },
  fail: function(res) {
    my.alert({
      content: JSON.stringify(res),
    });
  },
});
```

Use Ref to Get Component Instance {#use-ref-to-get-component-instance}

Last updated: 2022-07-03

Path: miniprogram_gcash

Use Ref to Get Component Instance

2022-07-03 18:44

The custom component supports using ref to get custom component instance. Use my.canIUse('component2') for compatibility handling.

Note:

ref can be used as well for parent component to get children component instance.

Sample Code:

copy

```
// /pages/index/index.js
Page({
  plus() {
    this.counter.plus();
  },
  saveRef(ref) {
    this.counter = ref;
  },
})
```

copy

```
<!-- /pages/index/index.axml -->
<counter ref="saveRef" />
<button onTap="plus">+</button>
```

Note: After ref is bound to saveRef, the saveRef method is triggered on component initialization.

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 0,
  },
  methods: {
    plus() {
      this.setData({ counter: this.data.counter + 1 })
    },
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
```

Use Ref to Get Component Instance {#use-ref-to-get-component-instance}

Last updated: 2021-05-09

Path: miniprogram_gcash

Use Ref to Get Component Instance

2021-05-09 18:43

The custom component supports using ref to get custom component instance. Use my.canIUse('component2') for compatibility handling.

Note:

ref can be used as well for parent component to get children component instance.

Sample Code:

copy

```
// /pages/index/index.js
Page({
  plus() {
    this.counter.plus();
  },
  saveRef(ref) {
    this.counter = ref;
  },
})
```

copy

```
<!-- /pages/index/index.axml -->
<counter ref="saveRef" />
<button onTap="plus">+</button>
```

Note: After ref is bound to saveRef, the saveRef method is triggered on component initialization.

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 0,
  },
  methods: {
```

```

    plus() {
        this.setData({ counter: this.data.counter + 1 })
    },
},
})

```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
```

Use TradeNO to pay {#use-tradeno-to-pay}

Last updated: 2022-07-03

Path: miniprogram_gcash

Use TradeNO to pay

2022-07-03 18:44

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the [my.tradePay](#) API with tradeNo.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and creates an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button to make the payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the `my.tradePay` API to initiate a payment in the mini program, mini program developers must complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by tradeNo and obtain the integration guide from the wallet.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program Platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment services in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

Figure 1. Payment process

The payment process contains the following steps:

1. The user places an order in the mini program (Step 1).
2. The mini program client sends a request to create the order to the mini program server by calling the my.request API (Step 2).
3. The mini program server creates the order and sends the request to the wallet server via the server API provided by the wallet (Step 3 & 4).
4. The wallet server creates the order and generates tradeNo, then returns tradeNo to the mini program server (Step 5-7).
5. The mini program server returns tradeNo to the mini program client (Step 8).
6. The mini program client initiates the payment request by calling the my.tradePay API with tradeNo to the wallet app (Step 9).
7. The wallet app obtains the order information and renders the cashier page (Step 10-12).
8. The user confirms the payment and the wallet processes the payment request (Step 13-16).
9. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server (Step 17 & 18).
10. The mini program client displays the payment result (Step 19).

Note:

The payment flow is for reference and may vary depending on the API implementation of the wallet.

Sample code

Sample code for the my.tradePay API calling is as follows:

copy

```
my.tradePay({
  tradeNo: '201711152100110410533667792',
  success: function(res) {
    my.alert({
      content: JSON.stringify(res),
    })
  }
})
```

```

    });
},
fail: function(res) {
    my.alert({
        content: JSON.stringify(res),
    });
},
);
}
);

```

Use TradeNO to pay in Mini Program

2021-05-09 18:43

Users can use the wallet app to pay for the order placed in the mini program if the wallet app provides the payment service. This document introduces the payment by calling the my.tradePay API with *tradeNo*.

User experience

To complete a payment in the mini program, users usually follow the steps below:

1. The user chooses goods in the mini program and create an order, then presses the **Pay** button in the mini program.
2. The mini program redirects the user to the wallet app and the wallet app displays the payment page.
3. The user confirms the order information, such as the payee and amount, then clicks the **Pay** button for payment.
4. After confirming the payment, the wallet app displays the payment result and redirects the user back to the payment result page in the mini program.

Procedures

To use the *my.tradePay* API to initiate a payment in the mini program, mini program developers must complete the following steps:

1. Confirm that the payment service provided by the wallet app supports the payment by *tradeNO* and obtain the integration guide from the wallet.
2. Integrate the payment service at the mini program server side.
3. Create a mini program in the wallet workspace on the Mini Program platform, or make sure that the mini program can be published in the wallet app.
4. Provide goods and payment service in the mini program.
5. Publish the mini program.

Payment process

The following figure illustrates the payment process:

Figure 1. Payment process

The payment process contains the following steps:

1. The user places an order in the mini program. (Step 1)
2. The mini program client sends the create order request to the mini program server by calling the `my.request` API. (Step 2)
3. The mini program server creates the order and sends the request to the wallet server via the server API provided by the wallet. (Step 3 & 4)
4. The wallet server creates the order and generates *tradeNo*, and returns *tradeNo* to the mini program server. (Step 5-7)
5. The mini program server returns *tradeNo* to the mini program client. (Step 8)
6. The mini program client initiates the payment request by calling the `my.tradePay` API with *tradeNo* to the wallet app. (Step 9)
7. The wallet app obtains the order information and renders the cashier page. (Step 10-12)
8. The user confirms the payment and the wallet processes the payment request. (Step 13-16)
9. The wallet app returns the payment result to the mini program client. At the same time, the wallet server returns the payment result to the mini program server. (Step 17 & 18)
10. The mini program client displays the payment result. (Step 19)

Note:

The payment flow is for reference and might differ depending on the API implementation of the wallet.

Sample code

Sample code for the `my.tradePay` API calling:

copy

```
my.tradePay({
  tradeNo: '201711152100110410533667792',
  success: function(res) {
    my.alert({
      content: JSON.stringify(res),
    })
  }
})
```

```

    });
},
fail: function(res) {
    my.alert({
        content: JSON.stringify(res),
    });
},
);
}
);

```

User authorization {#user-authorization}

Last updated: 2022-07-07

Path: miniprogram_gcash

User authorization

2022-07-07 17:08

User authorization describes the process of obtaining a user's consent to access user information. It is based on the industry standard OAuth2.0 authorization mechanism. On the Mini Program Platform, developers need to get permission from users in the mini program before obtaining and using their information.

Terminology

	Name	Description
(scope)	A scope represents the scope of permissions that developers need to request user authorization. A scope contains at least one open API interface or JSAPI interface. One authorization can combine multiple scopes for combined authorization.	Authorization code
(auth_code)	Temporary user authorization credentials. After obtaining it, promptly exchange it for the access token mentioned below.	Access token or authorization token
(access_token or auth_token)	Long-term authorization credentials. It is used to call the site gateway to call the server-side authorization interface. Pay attention to the scope and validity of the authorization token.	Refresh token
(refresh_token)	Used to refresh and obtain a new access token after the access token expires. The refresh token also has a validity period.	

Scope list

	Scope	Description
auth_base		Authorized to obtain the unique user ID.
auth_user		Authorized to obtain the user information.

Access guidelines

Access process

Take obtaining the user information as an example. The overall access process is illustrated as below:

1. The mini program calls the `getAuthCode` JSAPI to get the authorization code (`authCode`) from the wallet [1.1].
2. The mini program calls the merchant server API with `authCode` [2].
3. The merchant server calls the `applyToken` OpenAPI and the authorized platform server returns the access token [2.2].
4. The merchant server saves the access token and returns the authorization result to the mini program [2.4].

Note: To authorize other information, use a different scope for the `scopes` parameter when calling `getAuthCode`.

Obtain authCode

You can obtain user authorization by calling the `my.getAuthCode` JSAPI and fetch the `authCode` in the success callback. For example:

copy

```
my.getAuthCode({
  scopes: ['auth_user'],
  success: (res) => {
    my.alert({
      content: res.authCode,
    });
  },
  failed: (res) => {
    console.log(res.authErrorScopes)
  },
});
```

Obtain accessToken

- For merchants: Before obtaining an `accessToken`, you need to get an `authCode` from the wallet. Then you can call the `applyToken` OpenAPI in exchange for `accessToken`.
- For developers: Developers can exchange `accessToken` and `userId` with the obtained `authCode`.

Call the server OpenAPI

After obtaining the `accessToken`, developers can continue to use the access token to call other authorization interfaces. Pay attention to the permission scope and validity period of the token.

API List

|||| --- | --- || **JS API** | **Description** || [my.getAuthCode](#) | Gets user's authorization code. ||
OpenAPI | **Description** || [v1/authorizations/applyToken](#) | Obtain the access token. |

FAQs

1. Why should developers use my.getAuthCode API?

All the reading and writing of user information on the Mini Program Platform can only be used after obtaining the user's consent. User authorization is based on the industry standard OAuth2.0 authorization mechanism. With this mechanism, developers can obtain user information on the Mini Program Platform.

2. Why is the user authorization API not allowed on the first screen of the mini program?

In order to create a better user experience on the mini program, user authorization guidance is not allowed on the first screen of the mini program. The guidance for user authorization should be given after the user fully understands the business content of the mini program. We recommend you add the mini program authorization into the business process.

3. Can userId be obtained through the user authorization API?

No, the userId needs to be obtained by calling the related API on the server side.

User authorization {#user-authorization}

Last updated: 2021-05-09

Path: miniprogram_gcash

User authorization

2021-05-09 18:43

Product Description

All the reading and writing of user information on the site open platform requires the user's permission before it can be used , user authorization is based on the international standard OAuth2.0 authorization mechanism. Based on this mechanism, developers can obtain site user information etc.

Terminology

| Terminology | Description | Remark || scope | Scope of authorization | A scope represents the scope of permissions that developers need to request user authorization. A scope contains at least one openapi interface or JSAPI interface. One authorization can combine multiple scopes for combined authorization. || auth_code | Authorization code | Temporary user authorization credentials, after obtaining it, please promptly exchange for the authorization token mentioned below. || access_token/auth_token | Authorization token, or access token | Long-term authorization credentials are used to call the site gateway for server-side authorization interface calls. Need to pay attention to the scope and validity of authorization token. || refresh_token | Refresh token | Used to refresh and obtain new authorization token after the authorization token expires, the refresh token also has a validity period. |

Related products

Obtain Basic Member Information

Scopes List

| Scopes | Description || USER_ID | Authorized to obtain the unique user ID. || USER_NICKNAME | Authorized to obtain the user nickname. || USER_NAME | Authorized to obtain the user name. || USER_LOGIN_ID | Authorized to obtain the user login ID. || HASH_LOGIN_ID | Authorized to obtain the hash user login ID. || USER_AVATAR | Authorized to obtain the user avatar. || USER_GENDER | Authorized to obtain the user gender. || USER_BIRTHDAY | Authorized to obtain the user birthday. || USER_NATIONALITY | Authorized to obtain the user nationality. || USER_CONTACTINFO | Authorized to obtain the user contact info. || auth_base | Authorized to obtain the unique user ID. || auth_user | Authorized to obtain user information. |

Access Guidelines

Access Process

Obtain user information as an example, the overall access process is as follows (if you need to authorize other information, you only need to use a different scope for the scopes parameter when calling getAuthCode).

App Obtains Authcode

The user authorization is obtained by calling the jsapi my.getAuthCode, and the authcode can be obtained in the success callback. The js code is as follows:

copy

```
my.getAuthCode({
  scopes: ['USER_ID'],
  success: (res) => {
    my.alert({
      content: res.authCode,
    });
  },
  failed: (res) => {
    console.log(res.authErrorScopes)
  },
});
```

Server Obtains Access Token

Merchant server can call v1/authorizations/applyToken interface in exchange for the access_token, developers can exchange access_token and userId with the obtained auth_code. auth_code as a ticket in exchange for access_token.

Call The Server Business API

After obtaining access_token, developers can continue to use the token to call other authorization interface. Please pay attention to the permission scope and timeliness of the token.

API List

| API | API Description | | my.getAuthCode | Obtain the authorization code. |

QA

Question: Why should developers must use my.getAuthCode API?

Answer: All the reading and writing of user information on the site open platform requires the user's permission before it can be used, user authorization is based on the international standard OAuth2.0 authorization mechanism. Based on this mechanism, developers can obtain site user information etc.

Question: Why is it not allowed to use the user authorization API on the first screen of the Mini Program?

Answer: In order to create a better Mini Program user experience, guiding user authorization on the first screen of the Mini Program is not allowed. It is necessary to guide the user authorization after the user fully understands the business content of the Mini Program. It is recommended to put the Mini Program authorization in the business process.

Question: Can the userId be obtained through the user authorization API?

Answer: No, userId needs to be obtained by calling api on the server side.

User information capability {#user-information-capability}

Last updated: 2022-07-03

Path: miniprogram_gcash

User information capability

2022-07-03 18:44

All the user information on the Mini Program Platform requires user's authorization. Based on the industry standard OAuth2.0 authorization mechanism, mini program developers can get user authorization to obtain user information.

Note: Developers must fully respect the privacy of users and properly use the user authorization. If the information is found to be used beyond the agreed scope or reasonable usage, the platform has the right to permanently withdraw the interface authority of mini program.

Prerequisites

- This capability is open to merchants who have become business partners of the wallet.
- Make sure that the integration and configuration have been completed and the mini program has been released.

Interaction process

Silence mode

The silence mode requires the user's consent on a native app to collect the required information. The interaction flow of the silence mode is illustrated as below:

1. The user opens the wallet app and is redirected to the merchant mini program.
2. The merchant mini program calls the `getAuthCode` JSAPI to request `authCode` from the wallet app.
3. The wallet app returns `authCode` to the merchant mini program, which sends `authCode` to the ISV or merchant server.
4. With the obtained `authCode` in step 3, the ISV or merchant server calls the `/version/oaths/applyToken` OpenAPI to request `accessToken` and `uid` from the wallet server.

Note: The `version` is the version of Open APIs, for example, `v1` or `v2`.

5. The wallet server returns `accessToken` and `uid` to the ISV or merchant server.

Notes:

- `authCode` is used to exchange for `accessToken`. Every time the user authorization is completed, `authCode` in the JSAPI response is different. `authCode` can only be used once and will automatically expire within one day.
- After the ISV or merchant obtains `accessToken` and `uid`:
- The ISV or merchant can use `accessToken` to call other OpenAPIs. For example, call the `inquiryUserInfoByAccessToken` OpenAPI to query the user information.
- The ISV or merchant can generate a **session** that maps to `accessToken` and `uid`, then set session expiration time and store the mapping. The session will be stored in the mini program framework.

User consent mode

The user consent mode is used to get public user information without further permission from wallets. The interaction flow of the user consent mode is illustrated as below:

Get user open info

When the merchant mini program intends to get some public information of users, such as name and avatar, use the user consent mode with the `getOpenUserInfo` JSAPI. The user needs to sign the agreement and clicks the **Accept** button. This function is used to display some personal data of the user in the mini program.

Get auth code

When the merchant mini program intends to get `authCode` for further usage, call the `getAuthCode` JSAPI by specifying the `scope` field.

API list

||||---|---|| **JSAPI | Description** || my.getOpenUserInfo | Gets user basic information, such as avatar, nickname, etc. || my.getAuthCode | Gets user's authentication code. ||

OpenAPI | Description || /{version}/authorizations/{apiName}

Note: The **version** is the version of Open APIs, for example, v1 or v2. | For details, see the Open APIs for Merchants chapter. || /{version}/users/inquiryUserInfo |

User permission requests {#user-permission-requests}

Last updated: 2021-05-10

Path: miniprogram_gcash

User permission requests

2021-05-10 04:11

To access a mini program user's device and user information, mini programs must obtain the user's permission. This document contains design guidelines for developers and designers to create a user-friendly journey for users to authorize mini programs to access the following types of information:

- Device information
- User information

A popup message will be displayed when the mini program requires a user's permission.

Device information

Device information includes the resources on user's devices, such as the current location, camera, microphone, photos, Bluetooth, and contacts. For device information, the following JSAPIs are available in the container for mini programs to call:

- [my.getLocation](#)
- [my.chooseImage](#)
- [my.saveImage](#)
- [my.scan](#)
- [my.getOpenUserInfo](#)

For more information, see **Developing Mini Programs > References > JSAPIs > Device > Settings**.

User information

User information includes a user's personal information, such as mobile phone number, basic information, wallet member information, points, coupons, and so on. For user information, the wallet app either implements or develops the corresponding APIs to be called for permission.

In some cases, user terms also need to be displayed and users need to agree with the terms for mini programs to access user information.

Design principles

Use the following principles as guidelines to design the user flow for requesting permissions:

- **Request permissions only when your mini program requires resources**

We do not suggest to request for permissions at the launch of the mini program, or request all permissions together at one time. However, if users must agree with user terms before using your mini program, you must display the terms when users enter your mini program for the first time.

- **Display clear choices for users to make**

Buttons must clearly distinguish the choices for users to make. The primary button is **Allow** and the secondary button is **Don't Allow**. It is not suggested to use **Cancel** as the secondary button because users will be confused about whether the permission is granted or not.

- **Explain the resources to be accessed specifically**

Provide texts to explain the resources to be accessed clearly. For example, display the user's mobile phone number to be accessed and the source of the number, or list the personal user information to be accessed.

- **Guide users to reverse the decision to grant permission**

If the user denies permission requests, you can explain the benefits of granting permissions in related scenarios and provide a link to where the user can reverse the decision.

Applicable scenarios

The following illustrate how these design principles can be applied.

Granting permissions is required

In this scenario, the user cannot enjoy the service provided by the mini program without granting permissions. To ensure that the user understands this, we suggest redirecting the user back to the previous page if the user clicks **Don't Allow**. When the user wants to use the same service, display the bottom sheet component requesting the permission again till the user grants the permission.

Granting permissions is not required

While granting permissions allows the user to have a smoother mini program experience, it is sometimes not necessary for the user to use certain mini program functions. For example, if a user grants the mini program permission to access the current location, the user would not have to manually input the address to use the function. When the user uses the same service in future, the bottom sheet component is displayed again to request the permission.

Options to ignore permission request or reverse decision

When granting the permission is not required, you can add the selection of **Do not ask again**. If the user checks the selection, the same permission request is not displayed again when the user does the same action within the mini program. However, if permissions are required for certain actions within the mini program, display the bottom sheet component to request the permission and guide the user to where the permission can be reversed.

Request permissions to link the wallet and merchant accounts

If a user has used a wallet app to sign up for a merchant mini program account, such as with an email address or phone number, the mini program can guide the user to link the mini program account with the wallet account.

Component and samples

Permissions requests are communicated to users via a bottom sheet component displayed at the bottom of the screen.

Bottom sheet

Bottom sheet is a UI component that slides from the bottom of the screen when the user makes a specific action. On the bottom sheet, the user can start a new task, make a choice, or confirm the to-do action. The bottom sheet component is significantly less disruptive than the popup modal, which appears in the middle of the screen.

The bottom sheet used to request for permissions consists of three parts:

- Mini program name: A right arrow is placed on the right of the mini program name to indicate that the mini program name is a link. The mini program name is linked to the **About Us** page.
- Requested resources: All requested resources and icons are listed clearly.
- Buttons: Display two opposite choices for users to make, such as **Allow** and **Don't Allow**.

As the mini program must request permissions each time the user uses the mini program, we suggest adding the **Remember my choice** selection so that users will not be prompted again.

Samples

Permission requests for resources on the user's mobile device

Permission requests for the user device include the access to contacts, photos, current location, microphone, Bluetooth, and so on. See the following UI samples for details.

Permission requests for the user information

User information includes the user's account, avatar, phone number, and so on. When accessing the user information, comply with the following rules:

- Explain the source of the information if required. For example, the phone number is retrieved from the phone's address book.
- Provide a button to allow users to change the information if required. For example, when accessing the user account or phone number, provide an option for the user to use another account or phone number.
- Provide a link to the terms for users as a reference.

See the following UI samples for details.

Use case

Vodapay, a digital wallet, cooperates with more merchants in the form of third-party mini programs. When users use the merchant mini program in the Vodapay wallet app for the first time, the merchant mini program requests all required permissions so that users can enjoy services provided by the mini program. At the same time, users must sign the terms provided by the merchant before using the mini program.

Verify Code {#verify-code}

Last updated: 2022-07-03

Path: miniprogram_gcash

Verify Code

2022-07-03 18:44

You can use the verify-code component to display the input box of the verification code.

Note:

The verify-code is a controlled component. The component value needs to be obtained by the *onInput* event.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "Verify-code",
  "usingComponents": {
    "verify-code": "mini-ali-ui/es/verify-code/index"
  }
}
```

.axml

copy

```

<view>
  <view style="margin-top: 10px;" />
  <view style="padding: 0 10px;">verify code box</view>
  <view style="margin-top: 10px;" />
  <verify-code
    onInput="onInput"
    value="{{verifyCode}}"
    onClear="onClear"
    last="{{true}}"
    countDown="{{10}}"
    initActive="{{false}}"
    onSend="onSend"></verify-code>
</view>

```

.js

copy

```

Page({
  data: {
    verifyCode: '',
  },
  onSend() {
    my.alert({
      title: 'verify code sent',
    });
  },
  onInput(e) {
    this.setData({
      verifyCode: e.detail.value,
    });
  },
});

```

Parameters

||||| --- | --- | --- || **Property | Type | Description** || className | String | Customized class. || label | String | Customized label text. The default value is Verification Code. || labelCls | String | Customized class for the label. || inputCls | String | Customized class for the input box. || last | Boolean | An indicator of whether the input box is the last one. The default value is false. || value | String | Input box value. || name | String | Component name, which is used to obtain data by submitting the form. || placeholder | String | Placeholder. || placeholderStyle | String | Style of the placeholder. || placeholderClass | String | Style class of the placeholder. || disabled | Boolean | An indicator of whether to disable the function of clearing the verification code. The default value is false. || maxlength | Number | Maximum length of the verification code. The default value is 140. || focus | Boolean | An indicator of whether to get focus. The default value is false. || clear | Boolean | An indicator of whether to clear the input. The default value is true, and takes effect only when the value of *disabled* is false. || onInput | (e: Object) => void | The event that is triggered when users tap the keyboard. || onConfirm |

(e: Object) => void | The event that is triggered when users tap the **Done** button on the keyboard. || onFocus | (e: Object) => void | The event that is triggered when an element gets the focus. || onBlur | (e: Object) => void | The event that is triggered when an element loses the focus. || onClear | () => void | The event that is triggered when users tap the **Clear** button. || txtSend | String | Text on the send verification code button. The default value is **Send**. || txtSendAgain | String | Text on the resend verification code button. The default value is **Resend**. || txtCountDown | String | Counting down text before resending the verification code, which does not include the time. The default value is **Resend later**. || initActive | Boolean | An indicator of whether to trigger the send button actively. The default value is **false**. When the value is **true**, count down the resending time automatically after the component is initially loaded. You can set the prompt information according to your requirements. |

Wallet onboarding

2022-07-07 17:08

Onboarding checklist

For wallets and other native apps, make sure the following steps are finished before you start using the platform.

As illustrated above, the wallet onboarding process consists of the following procedures:

1. Contact us to create a Mini Program workspace for your app.

In order for us to create a workspace, you're required to provide the following:

1. Your valid business license and point of contact
2. Your APK signature, bundle ID, and package name
3. Customize your workspace.

Once your Mini Program workspace creation request is approved, you will receive a dedicated URL to access your workspace in the Mini Program Platform. You then make the following configuration settings:

1. Replace the default URL to your business domain by configuring a reverse proxy server.
2. Customize the UI by replacing the default logo/favicon with your preferred logo.
3. Customize the email service.
4. Integrate the SDK (Android and iOS).

Download the configuration guide from your Platform and follow the steps in this guide to initialize the SDK. For more information, see *AC SDK Integration Guide*.

4. Implement the standard JSAPIs.

While the SDK provides you with the core Mini Program functionality, you can get enhanced features with a customized implementation of standard JSAPIs. For instance, when a Mini Program invokes the payment function, you are recommended to launch the existing standard payment flow instead of a completely new one. For more information, see [JSAPIs](#).

5. Implement the standard Open APIs.

In addition to the client-side JSAPIs, you also need to implement the server-side APIs, in order to enable the capabilities, such as OAuth and Payment. For more information, see [Open APIs](#).

Now you can start using the Mini Program Platform.

Next steps

[Merchant onboarding](#)

Contact us

If you're interested in using Mini Programs and the Mini Program Platform, please send us an email.

What's New {#what's-new}

Last updated: 2021-05-10

Path: miniprogram_gcash

What's New

2021-05-10 04:19

What's New provides you with new, enhanced or deleted product features and system capabilities.

2021.4.27

Enhanced features

In the [Quality](#) page, you can see statistics for HTTP requests, JSAPI calls, JS errors, and details of abnormal URLs.

2021.4.14

Enhanced features

In the list page of [Manage Mini Program](#), you can view the past performance, real-time analysis, and quality of each mini program and navigate to these pages.

In the detail page of a mini program, you can see the expiration time of the QR code for testing.

In the [Real-Time Analysis](#) page, you can see the success rate and error details of JSAPI calls.

Deleted features

The **Launch** feature is no longer available from the navigation menu.

Workflow procedures {#workflow-procedures}

Last updated: 2024-12-24

Path: miniprogram_gcash

Workflow procedures

2024-12-24 21:43

This topic introduces the whole process that developers must go through to release a mini program.

Apply for an Account

Before developing a Mini Program, you need to create a developer account, which allows you to create, develop or publish your Mini Program.

Fill in the information, then you can finish the account creation process.

Ask the workspace admin to the role for you: Workspace Developer, Workspace Admin or Workspace Reviewer. Note that developer can develop the Mini Program, and only the Mini Program admin can create and publish the Mini Program.

Logging in

After completing the registration, log in directly at the login entry on the homepage of the Mini Program Platform.

Create a Tenant Workspace

Register a Workspace in Mini Program Development Platform (MPDP)

Step 1 Provide the information of your organization

Please provide the following information and send us email.

- Workspace Name
- Scope of Business (Please find the attachment [MCC_20190701.xlsx](#), and send us the code)
- Business Address
- Business Representative Name & Contact Email (You can provide more than one. He/She will become the primary workspace admin of the platform)

Step 2 Be patient

It will take us 5 business days to generate a workspace and customized Mini Program Studio. Please be patient and reach us if you have any question.

Step 3 Your Tenant Workspace is generated

We will send you back a confirmation email with workspace account information once the workspace is generated.

Invite members and set roles

Give members controlled access to your Workspace

You can invite other members to access your workspace. To protect your sensitive information or restrict the actions they can perform, user roles limit their access. Each member must be assigned a role(In tenant space, you can set the user to be Workspace admin, Workspace reviewer, Workspace Developer) when they are added.

Team members and user roles are managed in your workspace "Members" settings page. You can add new members individually, or invite multiple users at the same time.

The "Members: settings page only allowed for workspace admin to view and manage.

Workspace

Workspace - General

Path: Workspace Manage

||||---|---|| **Role | Authorization** || Workspace Admin | - Able to view the workspace informations. |

When you first created a Workspace by providing your company's info., our team would generate a workspace with listing all the info. you have provided on the Workspace - general tab

||||---|---|| **Field | Description** || Workspace ID | Generated by Platform. || Workspace Name | Rule of naming:

- You can't change the name after workspace is generated
- Character combination A-Z, a-z, 0-9
- No space

- Will be used as URL || Status || Business Address || Scope of Business | Select from the attachment.

 MCC_20190701.xlsx || Business Representative | The business representative will be the Workspace Admin as well. || Representative email ||

- You can contact us to request for information change.

App Manage

Path: App Manage - App detail

||| --- | --- || **Role | Authorization** || Workspace Admin | - Able to add/view App information. |

||| --- | --- || **Field | Description** || Mini Program Accessing Key | Mini Program Accessing Key:

An unique key allowing container SDKs to access Mini Program data through SaaS. || Mini Program Upload Key | Mini Program Upload Key:

- An unique key allowing Mini Program Bundles to build and upload to the Console.
- Container verification.

When you are ready to publish your mini program, you need to sign yourCopy mini program and upload it to a workspace portal. |

Members

For more information, see Workspace member roles.

Path: Workspace - Members

||| --- | --- || **Role | Authorization** || Workspace Admin | - Able to add/view the member(s).

- Able to set member(s) as other roles. |

||| --- | --- || **Field | Description** || Member's login email | User's registered email. || Username ||| Role | Workspace roles:

Workspace Developer,

Workspace Admin,

Workspace Reviewer.

- When users first join the workspace, he/she would assign as Developer (Assigned to Mini Program: unassigned), Workspace Admin could set him/her as other roles, such as Workspace Admin;

Mini program Admin(Assigned to Mini Program: unassigned): Able to create a new mini program. || Status | Member Status:

1. Active; corresponding action: block.

2. Inactive; corresponding action: unblock.

- Even the user got blocked, he/she could still log into the console. But the user would not able to access to the workspace and mini program on the console and Mini Program Studio. || Start Date | When user first joined the workspace. || Action | - Set as

Workspace Admin/Workspace Reviewer/Workspace Developer.

- Block ,

Confirm notification: If the member has been blocked, he/she will not be able to view or operate all mini programs he/she has been joined.

Are you sure you want to block the member?

- Unblock , Confirm notification: If you unblock the member, he/she will be able to view or operate all mini programs he/she has been joined.

Are you sure you want to unblock the member? |

Workspace member roles

2022-07-07 17:08

This topic provides you with an overview of the member roles and the main duties of roles in the tenant workspace and developer workspace. Before you dive into the following sections, check the definitions below:

- **Tenant workspace** is where native apps manage their mini programs.
- **Developer workspace** is where merchants manage their mini programs.

Overview

A role is a set of defined access permissions. It can be used to grant authorizations to members who join a workspace on Mini Program Platform. Based on the assigned role, a member can perform specific operations in the workspace.

Default roles

There are total seven roles on Mini Program Platform:

For more details about each role, see the following sections.

Tenant workspace

The tenant workspace has four roles that can be assigned to members:

- **Workspace Admin** is the super administrator in charge of workspaces and the whole life cycle of mini programs of the native app, who is usually the first one to apply for joining the platform. Workspace admin can invite members to join the platform and assign roles to members. In addition, the role can also see mini programs of merchants.
- **Workspace Reviewer** is responsible for approvals from the native app and merchants, including requests related to mini programs and marketing. The role needs to review whether requests are in compliance with the local regulatory requirements.

- **Workspace Developer** is responsible for developing and releasing mini programs. The role can also add features for mini programs and JS APIs to Mini Program Platform.
- **Workspace Operator** is responsible for managing the operation and marketing of mini programs.

Wallet members can access different operations based on assigned roles. For more information, see [Member role authorization in tenant workspace](#).

Developer workspace

The developer workspace has three roles that can be assigned to members:

- **Developer Admin** is the super administrator in charge of the whole life cycle of mini programs of a merchant, who is usually the first one to apply for joining the platform as a merchant. Developer admin can invite members to join the platform and assign roles to members
- **Developer** is responsible for developing and releasing mini programs. The role can also monitor the quality and performance of mini programs.
- **Operator** is responsible for managing the operation and marketing of mini programs.

Merchant members can access different operations based on assigned roles. For more information, see [Member role authorization in developer workspace](#).

getApp

2022-07-03 18:44

A global `getApp()` function is available for obtaining the instance of currently running Mini Program. This is generally used in page to get the top-level app.

copy

```
var app = getApp()  
console.log(app.globalData) // Get globalData
```

Note:

- Do not call `getApp()` in `App()`. Instead, use `this` to get the app instance.
- After the instance is obtained with `getApp()`, do not call the lifecycle function of App.
- Please distinguish App global data and Page global data.

The global data can be set in `App()`. The individual sub-pages can get the global application instance through the global function `getApp()`. Here is an example.

copy

```
// app.js  
App({  
  globalData: 1  
)
```

copy

```
// a.js  
// localValue effective only in a.js  
var localValue = 'a'  
// generating app instance  
var app = getApp()  
// get global data and change it  
app.globalData++
```

copy

```
// b.js  
// localValue effective only in b.js  
var localValue = 'b'  
// if a.js runs first, the globalData returns 2  
console.log(getApp().globalData)
```

In the codes shown above, both the `a.js` and `b.js` have declared the variable `localValue`, but they will not affect each other, because the variable and function of each script take effect only in their own scope.

getCurrentPages {#getcurrentpages}

Last updated: 2021-05-10

Path: miniprogram_gcash

getCurrentPages

2021-05-10 03:43

`getCurrentPages()` is used to get the instance of the page stack, it will return an array of page. The first element is the home page, and the last element is the current page.

The framework maintains the current pages by stack. And the relationship of routing switch and page stack is shown in the following table.

	--	---		Routing Page Stack Behavior	Initialization Push new page into stack.
	Open a new page Push new page into stack.		Redirect of page Pop current page from stack and push new page into stack.	Page returned Pop current page from stack.	Tab switch Pop all pages from stack except the new tab page.

Following codes can help to detect whether current stack reaches 5 layer of pages.

```
copy

if (getCurrentPages().length === 5) {
    my.redirectTo({
        url: '/pages/logs/logs'
    });
} else {
    my.navigateTo({
```

```

        url: '/pages/index/index'
    });
}

```

Note: do not try to modify the page stack, or error about page routing and page status may happen.

FAQ

Q: How to get the path of current page by `getCurrentPages()`?

A: `JSON.stringify(getCurrentPages()[0].__proto__.route)` can get the path of current page.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/framework_page_getcurrentpages

image {#image}

Last updated: 2022-07-03

Path: miniprogram_gcash

image

2022-07-03 18:44

Image

Property	Type	Description
src	String	Image address.
mode	String	scaleToFill Image mode.
class	String	external style
style	String	Inline style
onLoad	EventHandle	Trigger upon image loading completion, event object event.detail = {height:'image height px', width:'image width px'}. onError
onError	EventHandle	Trigger on image loading error, event object event.detail = {errMsg: 'something wrong'}. onTap
onTap	EventHandle	Triggered when clicking on an image, and pass click events to the parent component. catchTap
catchTap	EventHandle	Triggered when clicking on an image, and do not pass click events to the parent component.

Note: The image component has default width 300px and height 225px

Mode

There are 13 modes, 4 of which are scaling mode and 9 are cropping mode.

Scaling Mode

Property	Description
scaleToFill	Scale without aspect ratio and stretch image width to fill the image element.
aspectFit	Scale with aspect ratio and show fully long side In other words, the whole image is displayed in full.
aspectFill	Scale with aspect ratio and ensure short side to be displayed fully. In other words, the image is complete in horizontal or vertical direction, and the other direction is cropped.
widthFix	Width not changed and height changed automatically with aspect ratio unchanged.

Cropping Mode

||||---|---|| **Property | Description** || top | Not scaling image, showing only top area. || bottom | Not scaling image, showing only bottom area. || center | Not scaling image, showing only central area. || left | Not scaling image, showing only left area. || right | Not scaling image, showing only right area. || top left | Not scaling image, showing only top left area. || top right | Not scaling image, showing only top right area. || bottom left | Not scaling image, showing only bottom left area. || bottom right | Not scaling image, showing only bottom right area. |

Note: The image height cannot be set as auto. If the image height has to be auto, just set mode as widthFix.

Sceenshot

Original Image

scaleToFill

Fit image completely without maintaining aspect ratio

aspectFit

Scale with aspect ratio and show fully long side

aspectFill

Scale with aspect ratio and ensure short side to be displayed fully.

widthFix

Width not changed and height changed automatically with aspect ratio unchanged

top

Not scaling image and showing only top area

bottom

Not scaling image and showing only bottom area

center

Not scaling image and showing only central area

left

Not scaling image and showing only left area

right

Not scaling image and showing only right area

top left

Not scaling image and showing only top left area

top right

Not scaling image and showing only right top area

bottom left

Not scaling image and showing only bottom left area

bottom right

Not scaling image and showing only bottom right area

Last updated: 2021-05-09

Path: miniprogram_gcash

image

2021-05-09 18:43

Image

Scan QR code to try:

```
||||| --- | --- | --- | --- || Property | Type | Default | Description || src | String || Image address. || mode | String | scaleToFill | Image mode. || class | String | external style || style | String | Inline style ||| onLoad | EventHandle || Trigger upon image loading completion, event object event.detail = {height:'image height px', width:'image width px'}. || onError | EventHandle || Trigger on image loading error, event object event.detail = {errMsg: 'something wrong'}. || onTap | EventHandle || Triggered when clicking on an image, and pass click events to the parent component. || catchTap | EventHandle || Triggered when clicking on an image, and do not pass click events to the parent component. |
```

Note: The image component has default width 300px and height 225px

Mode

There are 13 modes, 4 of which are scaling mode and 9 are cropping mode.

Scaling Mode

```
||||| --- | --- || Property | Description || scaleToFill | Scale without aspect ratio and stretch image width to fill the image element. || aspectFit | Scale with aspect ratio and show fully long side In other words, the whole image is displayed in full. || aspectFill | Scale with aspect ratio and ensure short side to be displayed fully. In other words, the image is complete in horizontal or vertical direction, and the other direction is cropped. || widthFix | Width not changed and height changed automatically with aspect ratio unchanged. |
```

Cropping Mode

```
||||| --- | --- || Property | Description || top | Not scaling image, showing only top area. | bottom | Not scaling image, showing only bottom area. || center | Not scaling image, showing only central area. || left | Not scaling image, showing only left area. || right | Not scaling image, showing only right area. || top left | Not scaling image, showing only top left area. || top right | Not scaling image, showing only top right area. || bottom left | Not scaling image, showing only bottom left area. || bottom right | Not scaling image, showing only bottom right area. |
```

Note: The image height cannot be set as auto. If the image height has to be auto, just set mode as widthFix.

Sceenshot

Original Image

scaleToFill

Fit image completely without maintaining aspect ratio

aspectFit

Scale with aspect ratio and show fully long side

aspectFill

Scale with aspect ratio and ensure short side to be displayed fully.

widthFix

Width not changed and height changed automatically with aspect ratio unchanged

top

Not scaling image and showing only top area

bottom

Not scaling image and showing only bottom area

center

Not scaling image and showing only central area

left

Not scaling image and showing only left area

right

Not scaling image and showing only right area

top left

Not scaling image and showing only top left area

top right

Not scaling image and showing only right top area

bottom left

Not scaling image and showing only bottom left area

bottom right

Not scaling image and showing only bottom right area

Sample Code

input {#input}

Last updated: 2021-05-09

Path: miniprogram_gcash

input

2021-05-09 18:43

Input box

Scan QR code to try:

Property	Type	Description
value	String	Initial contents.
name	String	Component name, used for the form submission of obtained data.
type	String	Input type, effective value: text, number, digit.
password	Boolean	false Is password type or not.
placeholder	String	Placeholder
placeholder-style	String	Specify placeholder style.
placeholder-class	String	Specify placeholder style class.
disabled	Boolean	false Disable or not.
maxlength		

```
| Number | 140 | Maximum length. || cursor | Number || Cursor location when specifying focus. || onInput | EventHandle || Trigger input event on keyboard entry, event.detail = {value: value}. || onConfirm | EventHandle || Trigger on clicking keyboard completion, event.detail = {value: value}. || onFocus | EventHandle || Trigger on getting focus, event.detail = {value: value}. || onBlur | EventHandle || Trigger on losing focus, event.detail = {value: value}. |
```

Note (For iOS):

Due to iOS system restrictions, the input component has the following known issues:

- The cursor of input might be misaligned with the input element.
- The keyboard might be hidden with long press onthe input.

To solve these issues, add **enableNative={{false}}** to the input element of your MiniProgram code to downgrade to pure HTML5 elements.

Now the **enableNative** propertyis set to false. In this case,the number type is no longer supported, and only text type input is supported for inputs.

Screenshot

Sample Code

copy

```
<input maxlength="10" placeholder="maximum entered length 10" />
<input onInput="bindKeyInput" placeholder="entry synchronized to view"/>
<input type="number" placeholder="This is a numeral entry box" />
<input password type="text" placeholder="This is a password entry box" />
<input type="digit" placeholder="numeral keyboard with decimal"/>
```

copy

```
Page({
  data: {
    inputValue: '',
  },
  bindKeyInput(e) {
    this.setData({
      inputValue: e.detail.value,
    });
  },
});
```

label {#label}

Last updated: 2021-05-09

Path: miniprogram_gcash

label

2021-05-09 18:43

The label can be used to improve the form component availability. Use the ‘for’ attribute to find the ‘id’ of the related component or place the component under the label. When it is clicked, the focus is on the related component.

The priority of ‘for’ is higher than that of internal component. When there are multiple components internally, the first component is triggered by default.

Currently the following controls can be bound: checkbox, radio, input, textarea.

Scan QR code to try:

||||| --- | --- | --- || **Property** | **Type** | **Description** || for | String | Id of the bound component. |

Screenshot

Sample Code

copy

```
<view class="section">
    <view class="title">Checkbox label cover checkbox</view>
    <checkbox-group>
        <view>
            <label>
                <checkbox value="aaa" />
                <text>aaa</text>
            </label>
        </view>
        <view>
            <label>
                <checkbox value="bbb" />
                <text>bbb</text>
            </label>
        </view>
    </checkbox-group>
</view>
<view class="section">
    <view class="title">Radio, associating with the 'for' attribute</view>
    <radio-group>
        <view>
            <radio id="aaa" value="aaa" />
            <label for="aaa">aaa</label>
        </view>
        <view>
            <radio id="bbb" value="bbb" />
            <label for="bbb">bbb</label>
        </view>
    </radio-group>
</view>
<view class="section">
    <view class="title">select only one when multiple checkboxes are clicked</view>
    <label>
        <checkbox>Check me</checkbox>
        <checkbox>Not checked</checkbox>
        <checkbox>Not checked</checkbox>
        <checkbox>Not checked</checkbox>
        <view>
            <text>Click Me</text>
        </view>
    </label>

map {#map}

Last updated: 2022-07-07

Path: miniprogram_gcash

map

2022-07-07 17:08

This topic introduces the map components. If multiple map components are displayed on the same page, different IDs are required. The map components are the native components in the application, which have the highest level of the hierarchy. No matter what the value of `zIndex` is, the level of other components on the page cannot be higher than that of the map components.

Related API: [my.createMapContext\(mapId\)](#)

Prerequisites

- Currently the map components support the Google Maps only.
- Do not use the map components in [scroll-view](#).
- The map components do not support CSS animation.
- If the user zooms in or zooms out the map, reset the value of `scale` in the `onRegionChange` function before setting the latitude and longitude of the location. Otherwise, the map restores to the original size. See sample codes of `regionchange` for details.
- The mini program does not support obtaining the latitude and longitude of the current map.

Sample codes

copy

```
<view>
<map id="map" longitude="103.855457" latitude="1.339712" scale="{{scale}}"
      controls="{{controls}}"
```

```
onControlTap="controlltap" markers="{{markers}}"  
onMarkerTap="markertap"  
polyline="{{polyline}}"  
circles="{{circles}}"  
onRegionChange="regionchange"  
onTap="tap"  
showLocation style="width: 100%; height: 300px;"  
includePoints="{{includePoints}}"></map>  
<button onTap="changeScale">changeScale</button>  
<button onTap="getCenterLocation">getCenterLocation</button>  
<button onTap="moveToLocation">moveToLocation</button>  
<button onTap="changeCenter">changeCenter</button>  
<button onTap="changeMarkers">changeMarkers</button>  
</view>
```

copy

```
Page({  
  data: {  
    scale: 14,  
    longitude: 103.855457,

        });
    },
})

```

Parameters

||||| --- | --- | --- | **Property** | **Type** | **Description** || style | String | Inline style. || class | String | Style name. || latitude | Number | The latitude of the central point. || longitude | Number | The longitude of the central point. || scale | Number | The zoom level. The value ranges from 5 to 18 and is 16 by default. || markers | Array | The location marker. See [markers](#) for details. || polyline | Array | The polyline. See [polyline](#) for details. || circles | Array | The circle. See [circles](#) for details. || polygon | Array | The polygon. See [polygon](#) for details. || show-location | Boolean | An indicator of whether to display the current location with directions. || include-points | Array | The view is extended in a small scale with the passed coordinates.

Example:

```
[{
    latitude: 1.350428,
    longitude: 103.861718,
}] || include-padding | Object | The view is displayed within the map padding.
```

Example:

```
[{
    left:0, right:0,
    top:0, bottom:0
}] || setting | Object | Settings.
```

Example:

```
{
    gestureEnable: 1, <br>
    showScale: 1, <br>
    showCompass: 1, <br>
```

```

tiltGesturesEnabled: 1,
trafficEnabled: 0,      <br>
showMapText: 0,
logoPosition: {
centerX: 150,
centerY: 90
}
} || onMarkerTap | EventHandle | Call this function when clicking on Marker.
Example:
{
markerId,
latitude,
longitude,
} || onCalloutTap | EventHandle | Call this function when clicking on the tooltip of
Marker.
Example:
{
markerId,
latitude,
longitude,
} || onControlTap | EventHandle | Call this function when clicking on control.
Example:
{
controlId
} || onRegionChange | EventHandle | Call this function when the view is changed.
Example:
{
type: "begin/end",
latitude,
longitude,
scale
} || onTap | EventHandle | Call this function when clicking on the map.
Example:
{
latitude,
longitude,
}

```

markers

The location marker.

Notes:

- With the `markers` parameter, multiple location markers can be displayed.
- The description of the location marker does not support English.

polygon

Specify a series of coordinates, which form a closed polygon based on the `points`.

||||| --- | --- | --- | --- || **Property** | **Description** | **Type** | **Required** || points | An array of the latitude and longitude.

Example:

```
[{
  latitude: 0,
  longitude: 0
}]
```

| Array | Yes || color | The stroke color. Use hexadecimal numbers to set colors.

Example: #eeeeeeAA | String | No || fillColor | The fill color. Use hexadecimal numbers to set colors.

Example: #eeeeeeAA | String | No || width | The stroke width. | Number | No |

polyline

Specify a series of coordinates, which are connected from the first item to the last item in an array.

||||| --- | --- | --- | --- || **Property** | **Description** | **Type** | **Required** || points | An array of the latitude and longitude.

Example:

```
[{
  latitude: 0,
  longitude: 0
}]
```

| Array | Yes || color | The stroke color. Use hexadecimal numbers to set colors.

Example: #eeeeeeAA | String | No || width | The stroke width. | Number | No || iconWidth | The icon width. | Number | No || zIndex | The zIndex compared to other polys. | Number | - || iconPath | Displayed icon.

Note:

The image path in the project directory. The path can be written as a relative path prefixed with a forward slash (/), which indicates a relative root directory of a mini program. If this parameter is specified, ignore the value of color. To create the multiple-color polyline, use iconPath and colorList jointly. Set the background of the icon to be transparent so that the multiple-color polyline is not covered. | String | - |

circles

Display a circle on the map.

||||| --- | --- | --- | --- || **Property** | **Description** | **Type** | **Required** || latitude | The latitude. The value ranges from -90 to 90. | Float | Yes || longitude | The longitude. The value ranges from -180 to 180. | Float | Yes || color | The stroke color. Use hexadecimal numbers to set colors.

Example: #eeeeeeAA | String | No || fillColor | The fill color. Use hexadecimal numbers to set colors.

Example: #eeeeeeAA | String | No || radius | The radius in meters. | Number | Yes || strokeWidth | The stroke width. | Number | No |

callout Deprecated

The customs tooltip over the location marker.

Property	Description	Type	Required
	The content in the tooltip, which is empty by default.	String	No

customCallout Deprecated

The customs background of the tooltip.

Property	Description	Type	Required
	The style of the background. Valid values are:	type	
- 0: Black background			
- 1: White background			
- 2:Background and text	Number	Yes	
	time	The time.	
	String	Yes	
	descList	The description array.	

Example:

```
{
  "type": 0,
  "time": "3",
  "descList": [
    {
      "desc": "Click to take a taxi",
      "descColor": "#ffffff"
    }
  ],
  "isShow": 1
}
```

fixedPoint

The fixed point based on the screen.

Property	Description	Type	Required
	The number of pixels in the horizontal direction from the upper-left corner of the map.	originX	
	Number	Yes	
	originY	The number of pixels in the vertical direction from the upper-left corner of the map.	
	Number	Yes	

The latitude and longitude must be set for the map components. Otherwise the default coordinate is Beijing's latitude and longitude.

Location marker design

Priority

- The customCallout, callout, and label are excluded with each other. The priority order is label > customCallout > callout.
- The style and icon are excluded with each other. The priority order is:
 - style > iconAppendStr
 - style > icon

style

||||---|---|| **Sample code** | **Sample legend** || copy

{
 type:1,
 text1:"Style1",

fontType:"small/standard/large" //standard by default
}
||

label

|||||---|---|---|| **Property** | **Required** | **Remark** || content | Yes | - | color | No | The default value is #000000. || fontsize | No | The default value is 14. || borderRadius | No | The default value is 20. || bgColor | No | The default value is #FFFFFF. || padding | No | The default value is 10. |

FAQs

How do the map components redirect the mini program to the Google Maps for the navigation?

Use the [my.openLocation API](#).

How to obtain the value of scale when the optimize property of the map components is true?

Use the onRegionChange function.

How to create the polygon area on the map manually?

Use the polygon property.

Does the text in iconAppendStr support line breaks?

No, the text in iconAppendStr does not support line breaks.

How to modify icons of the first item and the last item in the map components after iconPath is set?

Currently the modification is not supported.

movable-area

2021-05-09 18:43

A movable area of [movable-view](#) component. movable-area must set the width and height properties. Otherwise, the default 10px is used.

Sample Code

index.axml

copy

```
<!-- API-DEMO page/component/movable-view.axml -->
<view class="page">
    <view class="page-description">movable-view</view>
    <view class="page-section">
        <view class="page-section-title">movable-view is less than
        movable-area</view>
        <view class="page-section-demo">
            <movable-area>
                <movable-view x="{{x}}" y="{{y}}" direction="all">movable-
                view</movable-view>
            </movable-area>
        </view>
        <button style="margin-left: 10px; margin-right: 10px;" type="primary" onTap="onButtonTap">Click Me to Move to (30px, 30px)</button>
    </view>
    <view class="page-section">
        <view class="page-section-title">movable-view is greater than
        movable-area</view>
        <view class="page-section-demo">
            <movable-area>
```

```
<movable-view class="max" direction="all">movable-
view</movable-view>
    </movable-area>
</view>
</view>
<view class="page-section">
    <view class="page-section-title">Can only be moved
laterally</view>

movable-view

2022-07-03 18:44

movable-view can be dragged and slid in the page. The movable-view component must be in the movable-area component and must be a direct child node. Otherwise, the component can't move.

Notes:

- movable-view must set the width and height properties. Otherwise, the default value 10px is used.
- By default, movable-view uses absolute positioning, which can't be changed. The values of the top and left properties are 0 px.
- When movable-view is smaller than movable-area, the moving range of movable-view is within the movable-area. When movable-view is larger than movable-area, the moving range of movable-view must cover the movable-area. The x-axis direction and the y-axis direction are separately considered.

Sample Code

index.axml

copy

```
<!-- API-DEMO page/component/movable-view.axml -->
<view class="page">
    <view class="page-description">movable-view</view>
    <view class="page-section">
        <view class="page-section-title">movable-view is less than
        movable-area</view>
        <view class="page-section-demo">
            <movable-area>
                <movable-view x="{{x}}" y="{{y}}" direction="all">movable-
                view</movable-view>
            </movable-area>
        </view>
    </view>
</view>
```

```

        </view>
        <button style="margin-left: 10px; margin-right: 10px;" type="primary" onTap="onButtonTap">Click Me to Move to (30px, 30px)</button>
    </view>
    <view class="page-section">
        <view class="page-section-title">movable-view is greater than movable-area</view>
        <view class="page-section-demo">
            <movable-area>
                <movable-view class="max" direction="all">movable-view</movable-view>
            </movable-area>
        </view>
    </view>
    <view class="page-section">
        <view class="page-section-title">Can only be moved laterally</view>
        <view class="page-section-demo">

    },
    onButtonTap() {
        const { x, y } = this.data;
        if (x === 30) {

```

```
        this.setData({
            x: x + 1,
            y: y + 1,
        });
    } else {
        this.setData({
            x: 30,
            y: 30
        });
    }
},
});
```

index.json

copy

```
// API-DEMO page/component/movable-view.json
{
    "allowsBounceVertical": "NO"
}
```

index.acss

copy

```
/* API-DEMO page/component/movable-view.acss */
movable-area {
    height: 400rpx;
    width: 400rpx;
    margin: 50rpx 0rpx 0 50rpx;
    background-color: #ccc;
    overflow: hidden;
}

movable-view {
    display: flex;
    align-items: center;
    justify-content: center;
    height: 200rpx;
    width: 200rpx;
    background: #108ee9;
    color: #fff;
}

.max {
    width: 600rpx;
    height: 600rpx;
}
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Default** | **Description** || direction | String | none | The moving direction of movable-view. Valid values are "all", "vertical", "horizontal", and "none". || inertia | Boolean | false | This field specifies whether movable-view has inertia. || out-of-bounds | Boolean | false | This field specifies whether movable-view can move after the view container is out of the movable area. || x | Number | 0 | This field defines the offset in the direction of the x axis, which is converted to the left property of the component. If the value of x is not within the movable range, the component is automatically moved to the movable range. || y | Number | 0 | This field defines the offset in the direction of the Y-axis, which is direction is converted to the top property. If the value of Y is not within the movable range, it will be automatically moved to the movable range. || damping | Number | 20 | The damping coefficient, which is used to control the animation triggered when the value of x or y changes and the animation that is pulled back when the component exceeds the range. A higher value leads to faster movement. || friction | Number | 2 | The friction coefficient, which is used to control the animation that moves due to inertia. A higher value leads to higher friction and indicates that the movement stops earlier. Must be greater than 0. Otherwise the default value is used. || disabled | Boolean | false | This field specifies whether to disable the component. || scale | Boolean | false | This field specifies whether to support two-finger scaling. The effective area for scaling gestures falls within the movable-view by default. || scale-min | Number | 0.5 | The minimum value of the scaling level. || scale-max | Number | 10 | The maximum value of the scaling level. || scale-value | Number | 1 | The scale level. Can range from 0.5 to 10. || animation | Boolean | false | This field specifies whether to use animations. || onTouchStart | EventHandle | - | Finger touch starts and this event is passed to the parent node. || catchTouchStart | EventHandle | - | Finger touch starts and this event only acts on the component and is not passed to the parent node. || onTouchMove | EventHandle | - | Finger moves after touch, the event is passed to the parent node. || catchTouchMove | EventHandle | - | Finger moves after touch, the event only acts on the component and is not passed to the parent node. || onTouchEnd | EventHandle | - | The touch action ends, the event is passed to the parent node. || catchTouchEnd | EventHandle | - | The touch action ends, the event only acts on the component and is not passed to the parent node. || onTouchCancel | EventHandle | - | The touch action is interrupted, such as call reminding and popups. || onChange | EventHandle | - | The event triggered during dragging, event. detail = {x: x, y: y, source: touch}, where source shows the reason of the movement, for example, the value is touch. || onChangeEnd | EventHandle | - | The event triggered after dragging, event.detail = {x: x, y: y}. || onScale | EventHandle | - | The event triggered during zooming, event.detail = {x, y, scale}.

onChange return value detail.source

The source field shows the reason of the movement.

||||| --- | --- || **Value** | **Description** || touch | Dragging. || touch-out-of-bounds | The movable range is exceeded. || out-of-bounds | Pullback after the movable range is exceeded. || friction | Inertia. || Empty string | setData.

Instruction: Please check the **event type** in the [event introduction](#) for bubbling event.

Parameters

Object type with the following attributes:

	Property	Type	Required	Description
photoFilePath	String	No	Local file path of avatar.	
nickName	String	No	Nickname.	
lastName	String	No	Surname.	
middleName	String	No	Middle name.	
firstName	String	No	First name.	
remark	String	No	Remarks.	
mobilePhoneNumber	String	No	Cell number.	
addressCountry	String	No	Country in contact address.	
addressState	String	No	Province in contact address.	
addressCity	String	No	City in contact address.	
addressStreet	String	No	Street in contact address.	
addressPostalCode	String	No	Postcode in contact address.	
organization	String	No	Company.	
title	String	No	Title.	
workFaxNumber	String	No	Work fax.	
workPhoneNumber	String	No	Work phone number.	
hostNumber	String	No	Company phone number.	
email	String	No	Email.	
url	String	No	Website.	
workAddressCountry	String	No	Country in work address.	
workAddressState	String	No	Province in work address.	
workAddressCity	String	No	City in work address.	
workAddressStreet	String	No	Street in work address.	
workAddressPostalCode	String	No	Postcode in work address.	
homeFaxNumber	String	No	Home fax.	
homePhoneNumber	String	No	Home phone.	
homeAddressCountry	String	No	Country in home address.	
homeAddressState	String	No	Province in home address.	
homeAddressCity	String	No	City in home address.	
homeAddressStreet	String	No	Street in home address.	
homeAddressPostalCode	String	No	Postcode in home address.	
success	Function	No	Callback function upon call success.	
fail	Function	No	Callback function upon call failure.	
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).	

Depending on the support of contact App built in different ROM, the above fields may not support emoji or kaomoji. In such cases, this option is ignored.

Return Value

Success:

success = true

Failure:

||||| --- | --- | --- | **Error** | **ErrorMessage** | **Description** || 11 | fail cancel | The user cancels the operation. || 3 | fail \${detail} | Call failure, detail includes the detailed information. |

            });
        }
    }
);

```

Parameters

Object type with the following attributes:

	Property	Type	Required	Description
photoFilePath	String	No	Local file path of avatar.	
nickName	String	No	Nickname.	
lastName	String	No	Surname.	
middleName	String	No	Middle name.	
firstName	String	No	First name.	
remark	String	No	Remarks.	
mobilePhoneNumber	String	No	Cell number.	
addressCountry	String	No	Country in contact address.	
addressState	String	No	Province in contact address.	
addressCity	String	No	City in contact address.	
addressStreet	String	No	Street in contact address.	
addressPostalCode	String	No	Postcode in contact address.	
organization	String	No	Company.	
title	String	No	Title.	
workFaxNumber	String	No	Work fax.	
workPhoneNumber	String	No	Work phone number.	
hostNumber	String	No	Company phone number.	
email	String	No	Email.	
url	String	No	Website.	
workAddressCountry	String	No	Country in work address.	
workAddressState	String	No	Province in work address.	
workAddressCity	String	No	City in work address.	
workAddressStreet	String	No	Street in work address.	
workAddressPostalCode	String	No	Postcode in work address.	
homeFaxNumber	String	No	Home fax.	
homePhoneNumber	String	No	Home phone.	
homeAddressCountry	String	No	Country in home address.	
homeAddressState	String	No	Province in home address.	
homeAddressCity	String	No		

No | City in home address. || homeAddressStreet | String | No | Street in home address. || homeAddressPostalCode | String | No | Postcode in home address. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Depending on the support of contact App built in different ROM, the above fields may not support emoji or kaomoji. In such cases, this option is ignored.

Return Value

Success:

success = true

Failure:

||||| --- | --- | --- | | **Error** | **ErrorMessage** | **Description** || 11 | fail cancel | The user cancels the operation. || 3 | fail \${detail} | Call failure, detail includes the detailed information. |

my.alert

2021-05-09 18:43

Alert box

Sample Code

copy

```
my.alert({
  title: 'Tips',
  content: 'Your bill for this month has been released',
  buttonText: 'Show',
  success: () => {
    my.alert({
      title: 'Click Show ',
      content: 'Your bill for this month has been released'
    })
  }
})
```

```
    });
  },
});
});
```

Parameters

Property	Type	Required	Description
title	String	No	Title of the alert box.
content	String	No	Contents of the alert box.
buttonText	String	No	Button text, which is OK by default.
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

my.canIUse {#mycaniuse}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.canIUse

2022-07-03 18:44

Check whether the current Mini Program API, incoming parameter or return value, component, attribute, etc. are supported in the current version.

The parameters are called via \${API}.\${type}.\${param}.\${option} or \${component}.\${attribute}.\${option} mode.

- API is the name of the API
- type value object/return/callback, indicating the api judgment type
- param indicates an attribute name of the parameter
- option indicates the detailed attribute value of the parameter attribute
- component indicates the name of the component
- attribute indicates the name of the component attribute
- option indicates the value of the component attribute

Sample Code

copy

```
// check whether newly added API is available
my.canIUse('getFileInfo')
```

```
// check whether newly added property of API is available
my.canIUse('getLocation.object.type')
// check whether newly added returned property of API is available
my.canIUse('getSystemInfo.return.brand')
// check whether newly added property of component is available
my.canIUse('button.open-type.getAuthorize')
```

my.chooseFileFromDisk {#mychoosefilefromdisk}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.chooseFileFromDisk

2022-07-03 18:44

You can choose a file to upload. You can also view the details of the file or delete the file you have added.

Sample code

copy

```
<!--.axml-->  
<view class="page">  
    <view class="page-description">file API</view>  
    <view class="page-section-demo">  
        <button class="page-body-button"  
onTap="chooseFileFromDisk">Choose file from disk</button>  
        </view>  
    </view>  
</view>
```

copy

```
// .js  
Page({  
    chooseFileFromDisk(){  
        my.chooseFileFromDisk({  
            success: (res) => {  
                my.alert({  
                    content: JSON.stringify(res),  
                });  
            },  
            fail: (res) => {  
                my.alert({  
                    content: JSON.stringify(res),  
                });  
            },  
        });  
    },  
});
```

```

        my.alert({
            content: JSON.stringify(res),
        });
    });
},
});

```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** | **Required** || success | Function |
The callback function for a successful API call. | NO || fail | Function | The callback
function for a failed API call. | NO || complete | Function | The callback function used
when the API call is completed. This function is always executed no matter the call
succeeds or fails. | NO |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || apFilePath | string | The temporary
local file path. |

Failure callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || error | number | Error code. ||
errorMessage | string | Error message. |

Error codes

||||| --- | --- | --- || **Error code** | **Error message** | **Remark** || 4 | The JSAPI call is
denied. | The mini program that is developed by the merchant/ISV has no right to call the
JSAPI. || 12 | Errors occur when copying the file. ||| 15 | The user cancels the file
selection. ||| 16 | The user denies the permission to read the storage. | Android Only. || 17
| No permission to read the storage. | Android Only. || 18 | Choosing large file is not
supported. ||

Note:

The following list describes the difference between the error code 16 and 17:

- 16: The user denies the permission to read the storage for the current request.
- 17: The user denied the permission last time and chose to never asking the
permission again. In this case, the dialog box for the permission cannot pop up. The
error code of 17 is returned directly. The mini program developer requires to call the
[showAuthGuide](#) to guide the user to grant the related permission.

File size limit

If you choose a file that is too large, the mini program or the wallet app cannot run properly. For this reason, the file size is limited to 50MB. When the file size exceeds 50MB, the error code of 18 is returned and the corresponding error message is displayed.

my.chooseImage

2021-05-09 18:43

Choose an image from the camera or gallery of a device.

Sample Code

copy

```
my.chooseImage({  
  success: (res) => {  
    img.src = res.apFilePaths[0];  
  },  
});
```

Parameters

Property	Type	Required	Description
sizeType	StringArray No Original image, compressed image, both by default.		sourceType String Array No Camera or album, ['camera', 'album'] by default.
success	Function No Callback function upon call success.		fail Function No Callback function upon call failure.
complete	Function No Callback function upon call completion (to be executed upon either call success or failure).		

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

Property	Type	Description
apFilePaths	String Array	Image file description.

Error Code

Error	Description
11	User cancels operation.

Parameters

Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || name | String | Selected contact name. || mobile | String | Selected contact phone. |

Error Code

||||| --- | --- || **Error Code** | **Description** || 10 | No permission. || 11 | The user cancels the operation (or the device does not authorize use of the directory). |

my.choosePhoneContact

2022-07-03 18:44

Select the phone number of a contact in the local system directory.

Sample Code

copy

```
//.json
{
    "defaultTitle": "Contact"
}
```

copy

```
<!-- .axml -->

my.clearStorage

2022-07-03 18:44

Clear local data cache.

This is an asynchronous interface.

Clearing the webview embedded storage data will not clear the storage data of the Mini Program.

Sample Code

copy

```
my.clearStorage();
```

my.closeBluetoothAdapter {#myclosebluetoothadapter}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.closeBluetoothAdapter

2022-07-03 18:44

Use this API to close the Bluetooth module in the mini program. You can call the following mini program API and receive event callbacks that are related to the Bluetooth module in the effective period when you the API `my.openBluetoothAdapter` is called. The effective period is ended when the API `my.closeBluetoothAdapter` is called.

Instructions :

- Call this API to disconnect all the established Bluetooth connections and releases system resources.
- It's recommend to call this API after you end the Bluetooth process of the Mini Program, which is in pair with the API `my.openBluetoothAdapter`.
- Calling the API `my.closeBluetoothAdapter` is asynchronous to releasing resources. It's recommend to call the API `my.closeBluetoothAdapter` and `my.openBluetoothAdapter` as part of the exception handling process. Synchronization errors might error if you reinitialize the process.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

my.closeBluetoothAdapter

2021-05-09 18:43

Use this API to close the Bluetooth module in the mini program. You can call the following mini program API and receive event callbacks that are related to the Bluetooth module in the effective period when you the API `my.openBluetoothAdapter` is called. The effective period is ended when the API `my.closeBluetoothAdapter` is called.

Instructions :

- Call this API to disconnect all the established Bluetooth connections and releases system resources.
- It's recommend to call this API after you end the Bluetooth process of the Mini Program, which is in pair with the API `my.openBluetoothAdapter`.
- Calling the API `my.closeBluetoothAdapter` is asynchronous to releasing resources. It's recommend to call the API `my.closeBluetoothAdapter` and `my.openBluetoothAdapter` as part of the exception handling process. Synchronization errors might error if you reinitialize the process.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function for a completed API call (Regardless of whether the call is successful or not). |

my.closeSocket

2022-07-03 18:44

Use this API to disable the WebSocket connection.

Sample Code

copy

```
my.onSocketOpen(function() {
  my.closeSocket()
})

my.onSocketClose(function(res) {
  console.log('The WebSocket is closed!')
})
```

Note: The case is only for reference. Please use your own URL to test.

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

})

my.onSocketClose(function(res) {
  console.log('The WebSocket is closed!')
})
```

Note: The case is only for reference. Please use your own URL to test.

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.compressImage

2021-05-10 03:43

Compress large images to fulfill the size restrictions from some mini programs.

Parameters

||||| --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | | apFilePaths | Array | Yes | An array of the image paths to be compressed. | | compressLevel | int | No | The image quality after the compress. Valid values are:

- 0: Low quality
- 1: Medium quality
- 2: High quality
- 4: The quality depends on the network. When the network is Wi-Fi, the image is compressed to the high-quality image. Otherwise, the image is compressed to the medium-quality image.

The default value is 4. | | success | Function | No | The callback method that indicates a successful call. | | fail | Function | No | The callback method that indicates a failed call. | | complete | Function | No | The callback method that indicates the call is completed (this will be executed regardless of whether the call succeeds or fails). |

Success callback function

||||| --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | | apFilePaths | Array | Yes | The local file path of the compressed image. |

Error code

||||| --- | --- | --- | --- | **Error Code** | **Error Message** | **Description** | | 2 | Compress failed | Failed to compress all images. | | Invalid parameter | Failed to compress one of all images. |

my.compressImage

2022-07-03 18:44

Compress large images to fulfill the size restrictions from some mini programs.

Parameters

	Property	Type	Required	Description
apFilePaths	Array	No	The array of image paths to be compressed.	
compressLevel	int	No	The image quality after compression. Valid values are:	
- 0	Low quality			
- 1	Medium quality			
- 2	High quality			
- 4	The quality depends on the network. When the network is Wi-Fi, the image is compressed to the high-quality image. Otherwise, the image is compressed to the medium-quality image.			
success	Function	No	The callback method that indicates a successful call.	
fail	Function	No	The callback method that indicates a failed call.	
complete	Function	No	The callback method that indicates the call is completed (this will be executed regardless of whether the call succeeds or fails).	

Success callback function

	Property	Type	Required	Description
localFilepath	Array	No	The local file path of the compressed image.	

Error code

	Error Code	Error Message	Description
1	2	Compress failed	Failed to compress all images.
2	1	Invalid parameter	Failed to compress one of all images.

my.confirm {#myconfirm}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.confirm

2021-05-09 18:43

Confirm box.

Sample Code

copy

```
my.confirm({
  title: 'Tips',
  content: 'Do you want to check the courier number: 1234567890?',
  confirmButtonText: 'Inquire now',
  cancelButtonText: 'Not needed',
  success: (result) => {
    my.alert({
      title: `${result.confirm}`,
    });
  },
});
```

Parameters

	Property	Type	Description
title	String	No	Title of the confirm box.
content	String	No	Content of the confirm box.
confirmButtonText	String	No	OK button text, which is “OK” by default.
cancelButtonText	String	No	Cancel button text, which is “Cancel” by default.
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

	Property	Type	Description
confirm	Boolean	Click Confirm to return true; click Cancel to return false.

my.connectBLEDevice {#myconnectbledevice}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.connectBLEDevice

2021-05-09 18:43

Use this API to connect to a Bluetooth Low Energy (BLE) device.

Instructions:

- If the Mini Program has previously discovered a Bluetooth device and successfully connected to it, you can directly pass the device ID obtained previously to connect to the device, without the need to perform a search operation.
- If the specified Bluetooth device is already connected, repeated connection request will return success directly.

Note: Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
/* .acss */
.help-info {
    padding:10px;
    color:#000000;
}
.help-title {
    padding:10px;
    color:#FC0D1B;
}
```

copy

```
// .json
{
    "defaultTitle": "Bluetooth"
}
```

copy

```

my.connectBLEDevice

2022-07-03 18:44

Use this API to connect to a Bluetooth Low Energy (BLE) device.

Instructions:

- If the Mini Program has previously discovered a Bluetooth device and successfully connected to it, you can directly pass the device ID obtained previously to connect to the device, without the need to perform a search operation.

- If the specified Bluetooth device is already connected, repeated connection request will return success directly.

Note: Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
/* .acss */
.help-info {
    padding:10px;
    color:#000000;
}
.help-title {
    padding:10px;
    color:#FC0D1B;
}
```

copy

```
// .json
{
    "defaultTitle": "Bluetooth"
}
```

copy

```

my.connectSocket {#myconnectsocket}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.connectSocket

2021-05-09 18:43

Use this API to create a WebSocket connection. An Mini Program can only have one WebSocket connection at a time. If a WebSocket connection already exists when a new one is created, the existing one will be automatically disabled.

Sample Code

copy

```

my.connectSocket({
  url: 'test.php',
  data: {},
  header:{
    'content-type': 'application/json'
  },
});

```

Note: The case is only for reference. Please use your own URL to test.

Parameters

The address of target server interface.

Note:

Some newly released Mini Programs only support WSS protocol. || data | Object | No | The request parameters. || header | Object | No | Header of the request. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Error Code

Error Code	Description	Solution
1	An unknown error.	-
2	A network connection already exists. An Mini Program can only keep one WebSocket connection for a period of time. If a WebSocket connection already exists when a new one is created, the existing one will be automatically disabled.	3 The URL parameter is null. Replace the URL link.
3	An unrecognized URL format. Replace the URL link.	4 The URL must start with WS or WSS. Replace the URL link.
4	5 The URL must start with WS or WSS. Replace the URL link.	6 Connection timed out. Try again later.
5	7 The HTTPS certificate returned by the server is invalid. The Mini Program must start a network request using HTTPS/WSS.	
6	When a request is sent, the HTTPS certificate of the server domain name is checked. If the check fails, the request cannot be successfully initiated. Due to system limitations, different platforms have different requirements for certificates. To ensure the compatibility of Mini Programs, developers are recommended to configure certificates according to the highest standards and use relevant tools to check existing certificates to ensure that the certificates are valid.	8 The protocol header returned by the server is invalid. Starting from May 2019, newly created Mini Programs must use HTTPS and WSS protocols by default and HTTP and WS protocols are not supported.
7	9 The Sec-WebSocket-Protocol request header is not specified for the WebSocket request. Please specify the Sec-WebSocket-Protocol request header.	10 The network is not available and the message cannot be sent. Please call <u>my.sendSocketMessage</u> to send a data message after connecting to the server normally. Use <u>my.onSocketOpen</u> to check if the connection with the server is correct.

Note:

To send data through a WebSocket connection, you need to use `my.connectSocket` to start the connection first, and then call `my.sendSocketMessage` to send data after the `my.onSocketOpen` callback. || 11 | Failed to send message. | Try again later. || 12 | Unable to request more memory to read network data. | Please check the memory. |

Replace the URL link. 5 The URL must start with WS or WSS. Replace the URL link. 6 Connection timed out. Try again later. 7 The HTTPS certificate returned by the server is invalid. The Mini Program must start a network request using HTTPS/WSS. When a request is sent, the HTTPS certificate of the server domain name is checked. If

the check fails, the request cannot be successfully initiated. Due to system limitations, different platforms have different requirements for certificates. To ensure the compatibility of Mini Programs, developers are recommended to configure certificates according to the highest standards and use relevant tools to check existing certificates to ensure that the certificates are valid.¹¹⁸ | The protocol header returned by the server is invalid. | Starting from May 2019, newly created Mini Programs must use HTTPS and WSS protocols by default and HTTP and WS protocols are not supported.¹¹⁹ | The Sec-WebSocket-Protocol request header is not specified for the WebSocket request. | Please specify the Sec-WebSocket-Protocol request header.¹¹¹⁰ | The network is not available and the message cannot be sent. | Please call my.sendSocketMessage to send a data message after connecting to the server normally. Use my.onSocketOpen to check if the connection with the server is correct.

Note:

To send data through a WebSocket connection, you need to use my.connectSocket to start the connection first, and then call my.sendSocketMessage to send data after the my.onSocketOpen callback.¹¹¹¹ | Failed to send message. | Try again later.¹¹¹² | Unable to request more memory to read network data. | Please check the memory.¹¹

my.createAnimation {#mycreateanimation}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.createAnimation

2022-07-03 18:44

Create an animation instance. Call the instance method to describe animation, and then use the `export` method of animation instance to export the animation data and transfer to the component `animation` attribute.

Note: After the `export` method is called, the previous animation operation will be cleared.

Sample Code

copy

```
//.json
{
  "defaultTitle": "Animation"
}
```

copy

```
<!-- .axml -->
<view class="page">
    <view class="page-description">Animation API</view>
    <view class="page-section">
        <view class="page-section-title">my.createAnimation</view>
        <view class="page-section-demo">
            <view class="animation-element" animation="{{animation}}>
```

</view>

```
    </view>
    <view class="page-section-btns">
        <view type="primary" onTap="rotate">Rotate</view>
        <view type="primary" onTap="scale"> Scale</view>
        <view type="primary" onTap="translate">Translate</view>
    </view>
    <view class="page-section-btns">
        <view type="primary" onTap="skew">Skew</view>
        <view type="primary" onTap="rotateAndScale">Rotate and scale</view>
        <view type="primary" onTap="rotateThenScale">Rotate and then scale</view>
    </view>
    <view class="page-section-btns">
        <view type="primary" onTap="all">Expand all simultaneously</view>
    </view>
        <view type="primary" onTap="allInQueue">Expand all in order</view>
        <view type="primary" onTap="reset">Reset</view>
    </view>
</view>
```

copy

```
//.js
Page({
    onReady() {
        this.animation = my.createAnimation()
    },
    rotate() {
        this.animation.rotate(Math.random() * 720 - 360).step()
        this.setData({ animation: this.animation.export() })
    },
    scale() {
        this.animation.scale(Math.random() * 2).step()
        this.setData({ animation: this.animation.export() })
    },
    translate() {
        this.animation.translate(Math.random() * 100 - 50, Math.random() * 100 - 50).step()
        this.setData({ animation: this.animation.export() })
    }
})
```

```
},
skew() {
    this.animation.skew(Math.random() * 90, Math.random() * 90).step()
    this.setData({ animation: this.animation.export() })
},
rotateAndScale() {
    this.animation.rotate(Math.random() * 720 - 360)
    .scale(Math.random() * 2)
    .step()
    this.setData({ animation: this.animation.export() })
},
rotateThenScale() {
    this.animation.rotate(Math.random() * 720 - 360).step()
    .scale(Math.random() * 2).step()
    this.setData({ animation: this.animation.export() })
},
all() {
    this.animation.rotate(Math.random() * 720 - 360)
    .scale(Math.random() * 2)
    .translate(Math.random() * 100 - 50, Math.random() * 100 - 50)
    .skew(Math.random() * 90, Math.random() * 90)
    .step()
    this.setData({ animation: this.animation.export() })
},
allInQueue() {
    this.animation.rotate(Math.random() * 720 - 360).step()
    .scale(Math.random() * 2).step()
    .translate(Math.random() * 100 - 50, Math.random() * 100 -
50).step()
    .skew(Math.random() * 90, Math.random() * 90).step()
    this.setData({ animation: this.animation.export() })
},
reset() {
    this.animation.rotate3d(0, 0, 0, 0)
    .rotateX(0)
    .rotateY(0)
    .rotateZ(0)
    .scale(1)
    .translate(0, 0)
    .skew(0, 0)
    .step({ duration: 0 })
    this.setData({ animation: this.animation.export() })
}
})
```

copy

```
.animation-element {
    width: 200rpx;
    height: 200rpx;
    background-color: #108ee9;
```

```
    transform: scaleX(1) scaleY(1);
}
```

Parameters

Object type with the following attributes:

	Property	Type	Required	Description
duration	Integer	No	Animation duration, in ms, 400 by default.	
timeFunction	String	No	Define animation effect, linear by default, effective values including linear, ease, ease-in, ease-in-out, ease-out, step-start and step-end .	
delay	Integer	No	Animation delay, in ms, 0 by default.	
transformOrigin	String	No	Set transform-origin, 50% 50% 0 by default.	

Sample Code

copy

```
//.js
const animation = my.createAnimation({
  transformOrigin: "top right",
  duration: 3000,
  timeFunction: "ease-in-out",
  delay: 100,
})
```

Animation

The animation instance may call the following method to describe the animation. At the end of the call, the instance itself is returned. The chain call style is supported. When the view animation attribute is initialized as {}, error may appears on basic library 1.11.0 (not including 1.11.0) and lower version. It is recommended to initialize as null.

Style

	Method	Parameters	Description
opacity	value	Transparency, range 0~1.	
backgroundColor	color	Color value.	
width	length	Set the width:length values, in px, such as 300 px.	
height	length	Set the height:length values, in px, such as 300 px.	
top	length	Set the top:length values, in px, such as 300 px.	
left	length	Set the left:length values, in px, such as 300 px.	
bottom	length	Set the bottom:length values, in px, such as 300 px.	
right	length	Set the right:length values, in px, such as 300 px.	

Rotation

	Method	Parameters	Description
rotate	deg	Deg range -180 ~ 180, rotate by deg degrees clockwise from origin.	
rotateX	deg	Deg range -180 ~ 180, rotate by deg degrees on X axis.	
rotateY	deg	Deg range -180 ~ 180, rotate by deg	

degrees on Y axis. || rotateZ | deg | Deg range -180 ~ 180, rotate by deg degrees on Z axis. || rotate3d | (x, y , z, deg) | Same as [transform-function rotate3d](#). |

Scale

||||| --- | --- | --- | **Method | Parameters | Description** || scale | sx,[sy] | When there is only one parameter, it indicates scaling sx times on X and Y axes at the same time. When there are two parameters, it indicates scaling sx times on X axis and sy times on Y axis. || scaleX | sx | Scale sx times on X axis. || scaleY | sy | Scale sy times on Y axis. || scaleZ | sz | Scale sz times on Z axis. || scale3d | (sx,sy,sz) | Scale sx times on X axis, sy times on Y axis and sz times on Z axis. |

Translate

||||| --- | --- | --- | **Method | Parameters | Description** || translate | tx,[ty] | When there is only one parameter, it indicates translating by tx on X axis. When there are two parameters, it indicates translating by tx on X axis and ty on Y axis. || translateX | tx | Translate by tx on X axis, in px. || translateY | ty | Translate by ty on Y axis, in px. || translateZ | tz | Translate by tz on Z axis, in px. || translate3d | (tx,ty,tz) | Translate by tx on X axis, ty on Y axis and tz on Z axis, in px. |

Skew

||||| --- | --- | --- | **Method | Parameters | Description** || skew | ax,[ay] | Range -180~180 When there is only one parameter, Y stays unchanged and X skews by ax degrees clockwise. When there are two parameters, X skews by ax degrees and Y skews by ay degrees. || skewX | ax | Range -180~180 Y stays unchanged and X skews by ax degrees clockwise. Degree. || skewY | ay | Range -180~180 X stays unchanged and Y skews by ay degrees clockwise. |

Matrix transformation

||||| --- | --- | --- | **Method | Parameters | Description** || matrix | (a,b,c,d,tx,ty) | Same as [transform-function](#). || matrix3d | (a1, b1, c1, d1, a2, b2, c2, d2, a3, b3, c3, d3, a4, b4, c4, d4) | Same as [transform-function matrix3d](#). |

Animation Queue

- When the animation operation method is called, it is required to call `step()` to indicates the completion of a group of animations. Within a group of animation, it is possible to call any number of animation methods. All animations in the group start at the same time. It does not enter into the next group until the current animation group ends.
- The `step()` can transfer a configuration parameter that is the same as `my.createAnimation()`, which is used to specify the configuration of the current animation group.

Parameters

Object type with the following attributes:

Property	Type	Required	Description
duration	Integer	No	Animation duration, in ms, 400 by default.
timeFunction	String	No	Define animation effect, linear by default, effective values including linear, ease, ease-in, ease-in-out, ease-out, step-start and step-end.
delay	Integer	No	Animation delay, in ms, 0 by default.
transformOrigin	String	No	Set transform-origin, 50% 50% 0 by default.

Sample Code

copy

```

//.js
const animation = my.createAnimation({
  transformOrigin: "top right",

```

```

duration: 3000,
timeFunction: "ease-in-out",
delay: 100,
})

```

Animation

The animation instance may call the following method to describe the animation. At the end of the call, the instance itself is returned. The chain call style is supported. When the view animation attribute is initialized as {}, error may appears on basic library 1.11.0 (not including 1.11.0) and lower version. It is recommended to initialize as null.

Style

--- --- ---	Method	Parameters	Description
-----------------	---------------	-------------------	--------------------

```

|| opacity | value | Transparency, range 0~1. || backgroundColor | color | Color value. || width | length | Set the width:length values, in px, such as 300 px. || height | length | Set the height:length values, in px, such as 300 px. || top | length | Set the top:length values, in px, such as 300 px. || left | length | Set the left:length values, in px, such as 300 px. || bottom | length | Set the bottom:length values, in px, such as 300 px. || right | length | Set the right:length values, in px, such as 300 px. |

```

Rotation

--- --- ---	Method	Parameters	Description
-----------------	---------------	-------------------	--------------------

```

|| rotate | deg | Deg range -180 ~ 180, rotate by deg degrees clockwise from origin. || rotateX | deg | Deg range -180 ~ 180, rotate by deg degrees on X axis. || rotateY | deg | Deg range -180 ~ 180, rotate by deg degrees on Y axis. || rotateZ | deg | Deg range -180 ~ 180, rotate by deg degrees on Z axis. || rotate3d | (x, y , z, deg) | Same as transform-function rotate3d. |

```

Scale

--- --- ---	Method	Parameters	Description
-----------------	---------------	-------------------	--------------------

```

|| scale | sx,[sy] | When there is only one parameter, it indicates scaling sx times on X and Y axes at the same time. When there are two parameters, it indicates scaling sx times on X axis and sy times on Y axis. || scaleX | sx | Scale sx times on X axis. || scaleY | sy | Scale sy times on Y axis. || scaleZ | sz | Scale sz times on Z axis. || scale3d | (sx,sy,sz) | Scale sx times on X axis, sy times on Y axis and sz times on Z axis. |

```

Translate

--- --- ---	Method	Parameters	Description
-----------------	---------------	-------------------	--------------------

```

|| translate | tx,[ty] | When there is only one parameter, it indicates translating by tx on X axis. When there are two parameters, it indicates translating by tx on X axis and ty on Y axis. || translateX | tx | Translate by tx on X axis, in px. || translateY | ty | Translate by ty on Y axis, in px. || translateZ | tz | Translate by tz on Z axis, in px. || translate3d | (tx,ty,tz) | Translate by tx on X axis, ty on Y axis and tz on Z axis, in px. |

```

Skew

||||| --- | --- | --- || **Method** | **Parameters** | **Description** || skew | ax,[ay] | Range -180~180 When there is only one parameter, Y stays unchanged and X skews by ax degrees clockwise. When there are two parameters, X skews by ax degrees and Y skews by ay degrees. || skewX | ax | Range -180~180 Y stays unchanged and X skews by ax degrees clockwise. Degree. || skewY | ay | Range -180~180 X stays unchanged and Y skews by ay degrees clockwise. |

Matrix transformation

||||| --- | --- | --- || **Method** | **Parameters** | **Description** || matrix | (a,b,c,d,tx,ty) | Same as [transform-function](#). || matrix3d | (a1, b1, c1, d1, a2, b2, c2, d2, a3, b3, c3, d3, a4, b4, c4, d4) | Same as [transform-function matrix3d](#). |

Animation Queue

- When the animation operation method is called, it is required to call `step()` to indicates the completion of a group of animations. Within a group of animation, it is possible to call any number of animation methods. All animations in the group start at the same time. It does not enter into the next group until the current animation group ends.
- The `step()` can transfer a configuration parameter that is the same as `my.createAnimation()`, which is used to specify the configuration of the current animation group.

my.createCanvasContext

2021-05-09 18:43

Create [canvas](#) context This canvas context works on the `<canvas/>` of the corresponding `canvasId` only.

Parameters

--- --- ---	Property	Type	Description
	canvasId	String	ID defined on the <canvas/>.

Return Value

CanvasContext

Sample Code

copy

```
//.js
const ctx = my.createCanvasContext('myCanvas')

const grd = ctx.createLinearGradient(30, 10, 120, 10)
grd.addColorStop(0, 'red')
grd.addColorStop(0.16, 'orange')
grd.addColorStop(0.33, 'yellow')
grd.addColorStop(0.5, 'green')
grd.addColorStop(0.66, 'cyan')
grd.addColorStop(0.83, 'blue')
grd.addColorStop(1, 'purple')

// Fill color
ctx.setFillStyle(grd)
ctx.fillRect(10, 10, 150, 80)
ctx.draw()
```

my.createMapContext {#mycreatemapcontext}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.createMapContext

2022-07-03 18:44

Call this API to create and return a map context object [mapContext](#).

For more information about the related components, see [map](#).

Parameter~~~~~

Property	Required	Description
mapId	Yes	The ID of the map component.

Return value

The return value is [MapContext](#).

Sample code

copy

```
//.axml
<view class="page-section">
    <map
        id="map"
        customMapStyle="light"
        longitude="{{longitude}}"
        latitude="{{latitude}}"
        scale="{{scale}}"
        controls="{{controls}}"
        onControlTap="controlltap"
        markers="{{markers}}"
        onMarkerTap="markertap"
        polyline="{{polyline}}"
        polygon="{{polygon}}"
        circles="{{circles}}"
        onRegionChange="regionchange"
        onTap="tap"
        onCalloutTap="callouttap"
        show-location style="width: 100%; height: 200px;"'
        include-points="{{includePoints}}"
        ground-overlays="{{ground-overlays}}>
    </map>
</view>
```

copy

```
//.js
Page({
    // ...
    onReady() {
        //Call my.createMapContext to obtain the map context.
        this.mapCtx = my.createMapContext('map');
    },
});
```

```
// ... ...  
}
```

PageContext.setData(Object)

Call this operation to initialize or reset map data. The parameters are optional.

Sample code

copy

```
// .js  
  
this.setData({  
    scale: 14,  
    longitude: 120.131441,  
    latitude: 30.279383,  
    'show-location':true,  
    // Add a ground overlay. Feature added in v10.1.35.  
    'ground-overlays':[{\  
        'include-points':[{// Upper-right\  
            latitude: 39.935029,\  
            longitude: 116.384377,\  
        },{// Lower-left\  
            latitude: 39.939577,\  
            longitude: 116.388331,\  
        }],\  
        image:'/image/groundoverlay.png',\  
        alpha:0.75,\  
        zIndex:0,\  
    }],

my.createWebViewContext {#mycreatewebviewcontext}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.createWebViewContext

2022-07-03 18:44

By creating webviewContext, it creates the capability to send messages from Mini Program to web-view. Create and return web-view context webViewContext object.

Sample Code

copy

```
<!-- .axml -->
<view>
    <web-view id="web-view-1" src="..." onMessage="onMessage"></web-
view>
</view>
```

copy

```
// .js
Page({
    onLoad() {
        this.webViewContext = my.createWebViewContext('web-view-1');
    },
    // Receive message from HTML5
    onMessage(e) {
        console.log(e); //{'sendToMiniProgram': '0'}
        // Send message to HTML5
        this.webViewContext.postMessage({'sendToWebView': '1'});
    }
})
```

copy

```
// .js
// my.onMessage needs to be defined in HTML5 js code at first to
// receive the message from Mini Program.
my.onMessage = function(e) {
    console.log(e); //{'sendToWebView': '1'}
}
// HTML5 sends message to Mini Program
my.postMessage({'sendToMiniProgram': '0'});
```

Note: The workflow of the above two-way communication capability is that HTML5 sends message to Mini Program at first. After the Mini Program receives the message, it sends message to HTML5.

Parameters

Object type with the following attributes:

Property	Type	Required	Description
webviewId	String		ID attribute corresponding to the web-view to be created.

Return Value

Create a webViewContext object

webViewContext is bound with a web-view component via webviewId to implement some functions. List of webViewContext object methods:

Method	Parameters	Description
postMessage	Object	The Mini Program sends message to the web-view component, and works with the my.postMessage provided by web-view.js to implement the two-way communication between Mini Program and web-view page.

my.disconnectBLEDevice {#mydisconnectbledevice}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.disconnectBLEDevice

2021-05-09 18:43

Use this API to disconnect from a Bluetooth Low Energy (BLE) device.

Instructions:

- Bluetooth device might be disconnected at any time. It is recommended to listen to `my.onBLEConnectionStateChanged` callback event. When the BLE device is disconnected, perform the reconnect operation as required.
- After read and write interface are called for a disconnected device, error 10006 is returned and reconnection is recommended.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || deviceId | String | Yes | The Bluetooth device ID. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.disconnectBLEDevice

2022-07-03 18:44

Use this API to disconnect from a Bluetooth Low Energy (BLE) device.

Instructions:

- Bluetooth device might be disconnected at any time. It is recommended to listen to [my.onBLEConnectionStateChanged](#) callback event. When the BLE device is disconnected, perform the reconnect operation as required.
- After read and write interface are called for a disconnected device, error 10006 is returned and reconnection is recommended.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || deviceId | String | Yes | The Bluetooth device ID. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.downloadFile

2022-07-03 18:44

Download a file resource to a local location.

Sample Code

copy

```
my.downloadFile({
  url: 'http://img.example.com/example.jpg',
  success({ apFilePath }) {
    my.previewImage({
      urls: [apFilePath],
    });
  },
  fail(res) {
    my.alert({
      content: res.errorMessage || res.error,
    });
  },
});
```

Parameters

|||||--- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | | url | String | Yes | Downloading file address. | | header | Object | No | HTTP request Header. | | success | Function | No | Callback function upon call success. | | fail | Function | No | Callback function upon call failure. | | complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

|||||--- | --- | --- | --- | **Property** | **Type** | **Description** | | apFilePath | String | Temporary file storage location. |

Error Code

||||| --- | --- || **Error | Description** || 12 | Downloading failed. || 13 | No right. |

my.getappIdSync

2022-07-03 18:44

Use this API to obtain the Mini Program App ID synchronously.

Sample Code

copy

```
const appIdRes = my.getappIdSync();
console.log(appIdRes.appId);
```

Return Value

||||| --- | --- | --- || **Property** | **Type** | **Description** || appId | String | The App ID of the current Mini Program. |

my.getAppIdSync

2021-05-09 18:43

Use this API to obtain the Mini Program App ID synchronously.

Sample Code

copy

```
const appIdRes = my.getAppIdSync();
console.log(appIdRes.appId);
```

Return Value

Property	Type	Description
appId	String	The App ID of the current Mini Program.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_basic_getappidsync

my.getAuthCode {#mygetauthcode}

Last updated: 2021-05-10

Path: miniprogram_gcash

my.getAuthCode

2021-05-10 22:04

Get authentication code.

Sample Code

copy

```
my.getAuthCode({
  scopes: 'auth_user',
  success: (res) => {
    my.alert({
      content: res.authCode,
    });
  },
});
```

Parameters

| Name | Type | Mandatory | Description | | scopes | String/Array | N | The scope of auth, there are two types: auth_base, auth_user, by default, its value is auth_base |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

| | | | | --- | --- | --- | --- | | Field | Type | Mandatory | Description | | authCode | String | Y | Auth code | | authErrorScopes | Key-value | Y | The scope that failed to grant auth, key is the scope and value is the error | | authSuccessScopes | Array | Y | The scope that succeed to grant auth |

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_openapi_getauthcode

my.getAuthCode {#mygetauthcode}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getAuthCode

2022-07-03 18:44

Call the API to obtain the authorization code (authCode). The authorization code can be used to obtain access token, so as to easily obtain the app user userId, nickname, etc.

For more information, refer to the [user authorization](#).

Sample code

copy

```
my.getAuthCode({
  scopes: ['auth_user'],
  success: (res) => {
    my.alert({
      content: res.authCode,
    });
  },
  fail: (res) => {
    console.log(res.authErrorScopes)
  },
});
```

Parameters

		Property	Type	Required	Description			
	scopes	String/Array	Yes		The scope of authorization, including: - auth_base - auth_user (auth_base is silent authorization)	success	Function	No
						fail	Function	No
						complete	Function	No
								Callback function upon call completion (to be executed upon either call success or failure).

Scopes description

		Scopes	Description	
	auth_base		Authorized to obtain the unique user ID.	
	auth_user		Authorized to obtain user information.	

Note:

- auth_base are used to silently obtain user ID, silent authorization does not pop the frame and directly obtains user information. All the other scopes are used for proactive user authorization.
- The auth_base and auth_user are legacy scopes and not recommended to be used.

Callback function

The incoming parameter is of the Object type with the following attributes:

		Property	Type	Required	Description			
	authCode	String	Yes		Authorization code.	authErrorScopes	Key-value	Yes
					The scope that failed to grant authorization, key is the scope and value is the error.	authSuccessScopes	Array	Yes
								The scope that succeed to grant authorization.

Successful response example

```
copy

{
    "authCode": "1591797390204",
    "authSuccessScopes": ["auth_user"]
}
```

Failure response example

```
copy

{
    "authErrorScopes": {
        "auth_user": "40006"
    }
}
```

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getBLEDeviceCharacteristics

2022-07-03 18:44

Use this API to obtain all characteristics in a Bluetooth device that is connected to the native.

Instruction:

After connection, execute my.getBLEDeviceServices and this interface before data can be exchanged with the Bluetooth device.

Sample Code

```
copy
```

```
/* .acss */

Parameters

|||||---|---|---|| **Property** | **Type** | **Required** | **Description** || deviceId | String |
Yes | The Bluetooth device ID. || serviceId | String | Yes | The UUID of the service
corresponding to a Bluetooth characteristic. || success | Function | No | The callback

function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || characteristic | Array | The list of device characteristics. |

characteristic

The Bluetooth device characteristic information.

||||| --- | --- | --- || **Property** | **Type** | **Description** || characteristicId | String | The Bluetooth device characteristic UUID. || serviceId | String | The UUID of the service corresponding to a Bluetooth characteristic. || value | Hex String | The hexadecimal value corresponding to a Bluetooth characteristic. || properties | Object | The operation types supported by this characteristic. |

properties

||||| --- | --- | --- || **Property** | **Type** | **Description** || read | Boolean | This field indicates whether this characteristic supports read operation. || write | Boolean | This field indicates whether this characteristic supports write operation. || notify | Boolean | This field indicates whether this characteristic supports notify operation. || indicate | Boolean | This field indicates whether this characteristic supports indicate operation. |

my.getBLEDeviceCharacteristics

2021-05-09 18:43

Use this API to obtain all characteristics in a Bluetooth device that is connected to the native.

Instruction:

After connection, execute my.getBLEDeviceServices and this interface before data can be exchanged with the Bluetooth device.

Sample Code

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || deviceId | String | Yes | The Bluetooth device ID. || serviceId | String | Yes | The UUID of the service corresponding to a Bluetooth characteristic. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || characteristic | Array | The list of device characteristics. |

characteristic

The Bluetooth device characteristic information.

||||| --- | --- | --- || **Property** | **Type** | **Description** || characteristicId | String | The Bluetooth device characteristic UUID. || serviceId | String | The UUID of the service corresponding to a Bluetooth characteristic. || value | Hex String | The hexadecimal value corresponding to a Bluetooth characteristic. || properties | Object | The operation types supported by this characteristic. |

properties

||||| --- | --- | --- || **Property** | **Type** | **Description** || read | Boolean | This field indicates whether this characteristic supports read operation. || write | Boolean | This field indicates whether this characteristic supports write operation. || notify | Boolean | This field indicates whether this characteristic supports notify operation. || indicate | Boolean | This field indicates whether this characteristic supports indicate operation. |

my.getBLEDeviceServices

2021-05-09 18:43

Use this API to obtain all services of Bluetooth devices that are connected to the native.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
//Obtain the services of the connected device
getBLEDeviceServices() {
    my.getConnectedBluetoothDevices({
        success: res => {
            if (res.devices.length === 0) {
                my.alert({ content: 'No connected devices' });
                return;
            }
            my.getBLEDeviceServices({
                deviceId: this.data.devid,
                success: res => {
                    my.alert({ content: JSON.stringify(res) });
                    this.setData({
                        serid: res.services[0].serviceId,
                    });
                },
                fail: error => {
                    my.alert({ content: JSON.stringify(error) });
                },
            });
        },
    });
},
```

Return Value Sample

copy

```
{
  "services": [{}\
    "isPrimary": true,\n    "serviceId": "00001800-0000-1000-8000-00805f9b34fb"\n  }, {}\

my.getBatteryInfo

2021-05-09 18:43

Use this API to asynchronously obtain the battery level and the charging state of the current device. No parameters are required.

Sample Code

copy

```
my.getBatteryInfo({
  success: (res) => {
    my.alert({ content: 'System information ' + JSON.stringify(res),
  });
});
```

```
        console.log({ content: 'System information ' +
JSON.stringify(res), });
    },
    fail: (error) => {
    my.alert({ content: 'Inquiry failed' + JSON.stringify(error), });
},
    complete: () => {
    my.alert({ title: 'Complete callback', });
},
})
})
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || level | Int | The battery level of the current device. || isCharging | Boolean | This property indicates whether the device is charging. |

my.getBatteryInfoSync

2021-05-09 18:43

Use this API to synchronously obtain the battery level and the charging state of the current device. No parameters are required.

Return Values

Property	Type	Description
level	Int	The battery level of the current device.
isCharging	Boolean	This property indicates whether the device is charging.

Sample Code

copy

```
var res = my.getBatteryInfoSync();
my.alert({content: 'System information '+JSON.stringify(res)});
console.log({content: 'System information '+JSON.stringify(res),});
```

Parameters

The input parameters are displayed in the following table:

||||| --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function for a completed API call (Regardless of whether the call is successful or not). |

Success Callback Function

The input parameters are displayed in the following table:

Property | Type | Description || discovering | Boolean | Indicates whether bluetooth device is being discovered. || available | Boolean | Indicates whether bluetooth is available (BLE should be supported and switched on). |

my.getBluetoothAdapterState

2022-07-03 18:44

Use this API to check the Bluetooth adapter status in the Mini Program.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

Property	Type	Required	Description
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function for a completed API call (Regardless of whether the call is successful or not).

Success Callback Function

The input parameters are displayed in the following table:

||||| --- | --- | --- || **Property** | **Type** | **Description** || discovering | Boolean | Indicates whether bluetooth device is being discovered. || available | Boolean | Indicates whether bluetooth is available (BLE should be supported and switched on). |

my.getBluetoothDevices

2021-05-10 03:43

Use this API to get all the bluetooth devices that are discovered, including those that are connected to the current device.

Instructions:

- You may not get the advertisData and RSSI in the simulator. Please debug in the production environment.
- For Integrated Development Environment (IDE) and Android devices, the device ID is the MAC address of the device; for iOS devie, the device ID is the UUID of the device. Therefore, do not hard code the device ID. You need to process the device ID on different platforms; iOS devices can be dynamically matched based on properties such as localName, advertisData, and manufacturerData.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Code Sample

copy

```
my.getBluetoothDevices({
  success: (res) => {
    console.log(res)
  },
  fail:(res) => {
  },
  complete: (res)=>{
  }
});
```

Parameters

The input parameters are displayed in the following table:

		Property	Type	Required	Description	success	Function
		No			The callback function for a successful API call.	fail	Function
					The callback function for a failed API call.	complete	Function
					The callback function for a completed API call (Regardless of whether the call is successful or not).		

Success Callback Function

The input parameters are displayed in the following table:

		Property	Type	Description	devices	Array	A list of all the devices that are discovered.
--	--	-----------------	-------------	--------------------	---------	-------	--

Device Object

		Property	Type	Description	name	String	Name of the bluetooth device.(For some devices, there's no name.)	deviceName(Compatibal with initial version)	String	Name of the bluetooth device.	localName	String	Name of
--	--	-----------------	-------------	--------------------	------	--------	---	---	--------	-------------------------------	-----------	--------	---------

the local device. || deviceId | String | Device ID || RSSI | Number | Received Signal Strength Indicator || advertisData | Hex String | Advertisement data of the device || manufacturerData | Hex String | Manufacturer data of the device |

my.getClipboard

2022-07-03 18:44

Get the clipboard data.

Sample Code

copy

```
Page({
  data: {
    text: '3.1415926',
    copy: '',
  },
  handlePaste() {
    my.getClipboard({
      success: ({ text }) => {
        this.setData({ copy: text });
      },
    });
  },
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || text | String | Clipboard data. |

my.getConnectedBluetoothDevices {#mygetconnectedbluetoothdevices}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getConnectedBluetoothDevices

2022-07-03 18:44

Use this API to get the bluetooth devices that are connected.

Instructions:

- If you have searched for a Bluetooth device in the mini program before, you can directly pass in the deviceId obtained by the previous search to connect to the device.
- If the specified bluetooth device is connected, you'll be returned with a success response if the connection is repeated.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

	Property	Type	Required	Description
deviceId	String	Yes	Device ID of the bluetooth.	success Function No The callback function for a successful API call.
fail	Function	Yes	fail Function No The callback function for a failed API call.	complete Function No The callback function for a completed API call (Regardless of whether the call is successful or not).
complete	Function	Yes

my.getConnectedBluetoothDevices

2021-05-09 18:43

Use this API to get the bluetooth devices that are connected.

Instructions:

- If you have searched for a Bluetooth device in the mini program before, you can directly pass in the deviceId obtained by the previous search to connect to the device.

- If the specified bluetooth device is connected, you'll be returned with a success response if the connection is repeated.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

Property	Type	Required	Description
deviceId	String	Yes	Device ID of the bluetooth.
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function for a completed API call (Regardless of whether the call is successful or not).

my.getLocation {#mygetlocation}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getLocation

2022-07-03 18:44

Get the current geographical location of the user.

Sample Code

copy

```
my.getLocation({
  success(res) {
    my.hideLoading();
    console.log(res)
    that.setData({
      hasLocation: true,
      location: formatLocation(res.longitude, res.latitude)
    })
  },
  fail() {
    my.hideLoading();
    my.alert({ title: 'location failed' });
  },
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || cacheTimeout | Number | No | longitude and latitude location cache expiry time in seconds. Default is 30s. Use of cache can speed up location process. Re-location is done upon cache expiry. | | type | Number | No | 0: default, get the longitude and latitude. | | success | Function | No | Callback function upon call success. | | fail | Function | No | Callback function upon call failure. | | complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || longitude | String | Longitude. || latitude | String | Latitude. || accuracy | String | Accuracy, in m. |

Error Code

||||| --- | --- | --- || **Error** | **Description** | **Solution** || 11 | Make sure the location related right has been enabled. | Prompt the user to enable location permission. || 12 | Network abnormality, try again later. | Prompt the user to check the current network. || 13 | Location failure, try again later. | - | 14 | Service location timeout. | Prompt the user to try again. |

my.getOpenUserInfo {#mygetopenuserinfo}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getOpenUserInfo

2022-07-03 18:44

Get the basic information about a user. This feature requires the user to deliberately trigger to activate the function. This function is not directly called by the API but rather waits for when the user has activated it by clicking a <button> component. If the Mini Program wants to get userId, please call my.getAuthCode.

For more information, please refer to the [obtain basic member information](#).

Use Attention

You need to set the value of the <button> component open-type to getAuthorize and set the value of the scope to userInfo . After the user clicks the authorization button, the Mini Program can get the user information returned by the my.getOpenUserInfo JSAPI.

my.getOpenUserInfo will send a network request to the server to obtain user information, so it may be take some time before the callback function invoked.

Parameters

||||| --- | --- | --- | --- || **Name** | **Type** | **Required** | **Description** || success | Function | No
| Callback function upon call success. || fail | Function | No | Callback function upon call
failure. || complete | Function | No | Callback function upon call completion (to be
executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Name** | **Type** | **Required** | **Description** || code | String | NO |
The result code. || msg | String | NO | The result message. || avatar | String | NO | User
avatar image url. || nickName | String | NO | User nickName. || gender | String | NO |
User gender. "m" is male, "f" is female. || countryCode | String | NO | The code of the
country where user is located. it should follow [ISO 3166-1 alpha-2 code](#) standard, such as
'US', 'SG'. || province | String | NO | The province where user is located. || city | String |
NO | The city where user is located. |

These fields are returned every time, but it will be an empty string if the app does not return the related information.

The maximum length of these fields are 128 bytes except avatar, the maximum length of avatar is 2048 bytes.

Sample Code

copy

```
<!-- .axml -->
<button
    a:if="{{canIUseAuthButton}}"
    open-type="getAuthorize"
    onGetAuthorize="onGetAuthorize"
    onError="onAuthError"
    scope='userInfo'>
</button>
```

Button Property Description

|||| --- | --- || **Name** | **Description** || open-type | getAuthorize(Must be this value). ||
scope | userInfo(Must be this value). || onGetAuthorize | Authorization success callback
(The Mini Program can call my.getOpenUserInfo to get information in this callback). ||
onError | Authorization failure callback (Including user rejection and system exceptions).
|

Get User Basic Information

After the user clicks the consent, the user basic information can be obtained through my.getOpenUserInfo().

copy

```
// .js
onGetAuthorize(res) {
    my.getOpenUserInfo({
        fail: (res) => {
        },
        success: (res) => {
            let userInfo = JSON.parse(res.response).response
        }
    });
}
```

Return Res Object In the Success Callback

- An example of a successfully res object returned is as follows:

copy

```
{
    "response": "{\"response\": {\"code\": \"10000\", \"msg\": \"Success\", \"countryCode\": \"code\", \"gender\": \"f\", \"nickName\": \"XXX\", \"avatar\": \"https://cdn/images/partner/XXXXXXXXX\", \"city\": \"city\", \"province\": \"province\"}}"
}
```

- If the function package of "Get Basic User Information" is not connected, the format example of returned res message is as follows:

copy

```
{
    "response": "{\"response\": {\"code\": \"40006\", \"msg\": \"Insufficient Permissions\", \"subCode\": \"isv.insufficient-isv-permissions\", \"subMsg\": \"Insufficient permissions\"}}"
}
```

my.getOpenUserInfo {#mygetopenuserinfo}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.getOpenUserInfo

2021-05-09 18:43

Get the basic information about a user. This feature requires the user to deliberately trigger to activate the function. This function is not directly called by the API but rather waits for when the user has activated it by clicking a <button> component. If the Mini Program wants to get userId, please call my.getAuthCode.

For more information, please refer to the [obtain basic member information](#).

Use Attention

You need to set the value of the <button> component open-type to getAuthorize and set the value of the scope to userInfo . After the user clicks the authorization button, the Mini Program can get the user information returned by the my.getOpenUserInfo JSAPI.

my.getOpenUserInfo will send a network request to the server to obtain user information, so it may be take some time before the callback function invoked.

Parameters

||||| --- | --- | --- | --- || **Name** | **Type** | **Required** | **Description** || success | Function | No
| Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Name** | **Type** | **Required** | **Description** || code | String | NO |
The result code. || msg | String | NO | The result message. || avatar | String | NO | User
avatar image url. || nickName | String | NO | User nickName. || gender | String | NO |
User gender. "m" is male , "f" is female. || countryCode | String | NO | The code of the
country where user is located. it should follow [ISO 3166-1 alpha-2 code](#) standard, such as
'US', 'SG'. || province | String | NO | The province where user is located. || city | String |
NO | The city where user is located. |

These fields are returned every time, but it will be an empty string if the app does not return the related information.

The maximum length of these fields are 128 bytes except avatar , the maximum length of avatar is 2048 bytes.

Sample Code

copy

```
<!-- .axml -->
<button
    a:if="{{canIUseAuthButton}}"
    open-type="getAuthorize"
    onGetAuthorize="onGetAuthorize"
    onError="onAuthError"
    scope='userInfo'>
</button>
```

Button Property Description

||| --- | --- || **Name | Description** || open-type | getAuthorize(Must be this value). || scope | userInfo(Must be this value). || onGetAuthorize | Authorization success callback (The Mini Program can call my.getOpenUserInfo to get information in this callback). || onError | Authorization failure callback (Including user rejection and system exceptions).
|

Get User Basic Information

After the user clicks the consent, the user basic information can be obtained through my.getOpenUserInfo().

copy

```
// .js
onGetAuthorize(res) {
    my.getOpenUserInfo({
        fail: (res) => {
        },
        success: (res) => {
            let userInfo = JSON.parse(res.response).response
        }
    });
}
```

Return Res Object In the Success Callback

- An example of a successfully res object returned is as follows:

copy

```
{
    "response": "{\"response\": {\"code\": \"10000\", \"msg\": \"Success\", \"countryCode\": \"code\", \"gender\": \"f\", \"nickName\": \"XXX\", \"avatar\": \"https://cdn/images/partner/XXXXXXXX\", \"city\": \"city\", \"province\": \"province\"}}"
```

- If the function package of "Get Basic User Information" is not connected, the format example of returned res message is as follows:

```
copy

{
    "response": "{\"response\":
{\\"code\\":\\"40006\\",\\"msg\\":\\"Insufficient
Permissions\\",\\"subCode\\":\\"isv.insufficient-isv-
permissions\\",\\"subMsg\\": \\"Insufficient permissions\\\"}}"
}
```

my.getRunScene

2021-05-09 18:43

Use this API to obtain the running version of the current Mini Program.

Sample Code

copy

```
my.getRunScene({
  success(result) {
    my.alert({
      title: 'Mini Program version',
      content:`${result.envVersion}`
    });
  },
})
```

Parameters

	Property	Type	Required	Description
	success	Function		success Function No The callback function for a successful API call.
	fail	Function		fail Function No The callback function for a failed API call.
	complete	Function		complete Function No The callback function used

when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success Callback Function

||||| --- | --- | --- || **Property** | **Type** | **Description** || envVersion | String | The current running version of the Mini Program. Valid values are:

- develop: development version
- release: release version |

Fail Callback Function

||||| --- | --- | --- || **Property** | **Type** | **Description** || error | String | The error code. || errorMessage | String | The error message. |

Error Code

|||| --- | --- || **Error Code** | **Description** || 3 | An unknown error has occurred. |

my.getSavedFileInfo {#mygetsavedfileinfo}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.getSavedFileInfo

2021-05-09 18:43

Get saved file information.

Sample Code

The `my.saveFile` saved address is required to use `my.getSavedFileInfo`

copy

```
var that = this;
my.chooseImage({
  success: (res) => {
    console.log(res.apFilePaths[0], 1212)
    my.saveFile({
      apFilePath: res.apFilePaths[0],
      success: (result) => {
        console.log(result, 1212)
        my.getSavedFileInfo({
          apFilePath: result.apFilePath,
          success: (resu) => {
            console.log(JSON.stringify(resu))
            that.filePath = resu
          }
        })
      },
    });
  },
});
```

Parameters

Object type with the following attributes:

Property	Type	Required	Description
<code>apFilePath</code>	<code>String</code>	Yes	File path.
<code>success</code>	<code>Function</code>	No	Callback function upon call success.
<code>fail</code>	<code>Function</code>	No	Callback function upon call failure.
<code>complete</code>	<code>Function</code>	No	Callback function upon call completion (to be executed upon either call success or failure).

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

Property	Type	Description
<code>size</code>	<code>Number</code>	File size.
<code>createTime</code>	<code>Number</code>	Timestamp for the created time.

my.getSavedFileInfo

2022-07-03 18:44

Get saved file information.

Sample Code

The my.saveFile saved address is required to use my.getSavedFileInfo

copy

```
var that = this;
my.chooseImage({
  success: (res) => {
    console.log(res.apFilePaths[0], 1212)
    my.saveFile({
      apFilePath: res.apFilePaths[0],
      success: (result) => {
        console.log(result, 1212)
        my.getSavedFileInfo({
          apFilePath: result.apFilePath,
          success: (resu) => {
            console.log(JSON.stringify(resu))
            that.filePath = resu
          }
        })
      },
    });
  },
});
```

Parameters

Object type with the following attributes:

Property	Type	Required	Description
apFilePath	String	Yes	File path.
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** || size | Number | File size. ||
 createTime | Number | Timestamp for the created time. |

my.getScreenOrientation

2022-07-03 18:44

Call this API to get screen orientation.

Sample code

copy

```

my.getScreenOrientation({
  success: (res) => {
    my.alert({
      title: 'success',
      content: JSON.stringify(res)
    })
  },
  fail: (res) => {
    my.alert({
      title: 'fail',

```

```

        content: JSON.stringify(res)
    })
}
})

```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | Callback function upon call success || fail | Function | No | Callback function upon call failure || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure) |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || success | Boolean | Specifies whether the call is successful. When the value is `true`, the call is successful. || orientation | String | Indicates the orientation of the screen, `portrait` or `landscape`. |

Fail callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || error | Number | The error code for the failure || errorMessage | String | The error message |

my.getSetting {#mygetsetting}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.getSetting

2021-05-09 18:43

Use this API to obtain the user's current settings. Only the permissions that have been requested by the Mini Program from the user are returned.

Sample Code

copy

```
my.getSetting({
  success: (res) => {
    /*
     * res.authSetting = {
     *   "location": true,
     *   "audioRecord": true,
     *   ...
     * }
    */
  }
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. See Sample Return Value for details. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || authSetting | Object | Results of user authorization. Keys are the values of scopes and values are boolean types, which shows whether the user gives the permission or not. See Scopes for details. |

Return Value Sample

```
copy

{
  "authSetting": {
    "camera": true,
    "location": true,
    "album": true,
    "userInfo": true,
    "phoneNumber": true
  }
}
```

Scopes

||||| --- | --- | --- || **Scope** | **API** | **Description** || location | my.getLocation | This field specifies whether to authorize access to geographic location. || album | my.chooseImage、 my.saveImage | This field specifies whether to authorize to save images to the albums. || camera | my.scan | This field specifies whether to authorize access to camera. || phoneNumber | my.getPhoneNumber | This field specifies whether to authorize access to phone number. || userInfo | my.getOpenUserInfo | This field specifies whether to authorize access to user information. |

my.getSetting {#mygetsetting}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getSetting

2022-07-03 18:44

Use this API to obtain the user's current settings. Only the permissions that have been requested by the Mini Program from the user are returned.

Sample Code

copy

```
my.getSetting({
  success: (res) => {
    /*
     * res.authSetting = {
     *   "location": true,
     *   "audioRecord": true,
     *   ...
     * }
    */
  }
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. See Sample Return Value for details. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || authSetting | Object | Results of user authorization. Keys are the values of scopes and values are boolean types, which shows whether the user gives the permission or not. See Scopes for details. |

Return Value Sample

copy

```
{
  "authSetting": {
    "camera": true,
    "location": true,
    "album": true,
    "userInfo": true,
    "phoneNumber": true
  }
}
```

Scopes

||||| --- | --- | --- || **Scope** | **API** | **Description** || location | my.getLocation | This field specifies whether to authorize access to geographic location. || album | my.chooseImage、 my.saveImage | This field specifies whether to authorize to save images to the albums. || camera | my.scan | This field specifies whether to authorize access to camera. || phoneNumber | my.getPhoneNumber | This field specifies whether to authorize access to phone number. || userInfo | my.getOpenUserInfo | This field specifies whether to authorize access to user information. |

my.getSiteInfo

2022-07-25 00:03

Use this API to obtain the site information.

Note:

Please make sure you use the Appx with 1.24.6 or higher versions in order to use this API.

Sample code

copy

```
my.getSiteInfo({
  success: (res) => {
    my.alert({
      content: JSON.stringify(res),
    });
  },
  fail: (res) => {
    my.alert({
      content: JSON.stringify(res),
    });
  }
});
```

```

    }
});
```

Input Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

||||| --- | --- | --- || **Property** | **Type** | **Description** || siteName | String | Following values are supported:
GCASH |

An example of a successfully returned message is as follows:

copy

```
{
  "siteName": "GCASH"
}
```

my.getStorage {#mygetstorage}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.getStorage

2021-05-09 18:43

Get cached data.

This is an asynchronous interface.

support the isolation between embedded webview cache and Mini Program cache. Getting the cache of the specified key of embedded webview will not return the cached data of the same key of the Mini Program.

Sample Code

copy

```
my.getStorage({
  key: 'currentCity',
  success: function(res) {
    my.alert({content: 'Success' + res.data.cityName});
  },
  fail: function(res){
    my.alert({content: res.errorMessage});
  }
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || key | String | Yes | Cache data key. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** || data | Object/String | Corresponding content of the key. |

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/api_storage_getstorage

my.getStorage {#mygetstorage}

my.getSystemInfo

2023-01-29 20:55

Get system information.

Sample Code

copy

```
Page({
  data: {
    systemInfo: {}
  },
  getSystemInfoPage() {
    my.getSystemInfo({
      success: (res) => {
        this.setData({
          systemInfo: res
        })
      }
    })
  },
})
```

Parameters

	Property	Type	Required	Description
success	Function	No	Callback function upon call success	
fail	Function	No	Callback function upon call failure	
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure.)	

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

	Property	Type	Description
model	String	Cellphone model	
pixelRatio	Number	Device pixel ratio	
windowWidth	Number	Window width	
windowHeight	Number	Window height	
language	String	The language set by the user in the app. If the app does not support the language setting, return the system language.	
version	String	App version number	
storage	String	Device disk capacity	
currentBattery	String	Current battery percentage	
system	String	System version	
platform	String	System name: Android, iOS	
titleBarHeight	Number	Title bar height	
statusBarHeight	Number	Status bar height	
screenWidth	Number	Screen width	
screenHeight	Number	Screen height	
brand	String	Cellphone brand	
fontSizeSetting	Number	User setting font size	
app	String	Current running client. The app value can refer to the following table.

my.getUpdateManager {#mygetupdatemanager}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.getUpdateManager

2022-07-03 18:44

Call this API to create an UpdateManager object. The UpdateManager is a globally unique manager of the version update, which is used to manage the mini program updates.

Return value

The return value is [UpdateManager](#).

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_update_getupdatemanager

my.hideBackHome {#myhidebackhome}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.hideBackHome

2021-05-09 18:43

Use this API to hide the home button in the top navigation bar, and the return-home option in the tab bar in the upper right corner.

Notes:

- By default, the home button is displayed if the page where an user enters on starting the Mini Program is not the homepage.
- If the tab bar is configured to redirect to pages/index/index in the app.json, the return-home option is not displayed.

Sample Code

copy

```
//.js
Page({
  onReady() {
    if (my.canIUse('hideBackHome')) {
      my.hideBackHome();
    }
  },
});
```

copy

```
//.js
onLoad(){
  my.reLaunch({
    url:'.../swiper/swiper'// An added page other than the homepage
  })

  setTimeout(() => {
    //Hide the home button after 5 seconds
    my.hideBackHome()
  }, 5000)
}
```

    ]\

}\

]// cascade sub-data list\
}],// Cascade data list
success:(res)=>{
    my.alert({title:JSON.stringify(res)})
}
});

}

)

```

Parameters

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | No | Title. || list | JSONArray | Yes | Selection data list. || name | String | Yes | Entry name. || subList | JSONArray | No | Sub-entry list. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || success | Boolean | Selection completed or not, returning false for cancellation. || result | JSONArray | Selection result, such as [{"name":"City"}, {"name":"District A"}, {"name":"Street A"}]. |

my.multiLevelSelect

2021-05-09 18:43

Cascade selection function, mainly used for selecting several levels of associated data, such as province, city and district.

Sample Code

copy

```
//.json
{
    "defaultTitle": "Cascade selector"
}
```

copy

```
<!-- .axml -->
<view class="page">
    <view class="page-description">Cascade selector API</view>
    <view class="page-section">
        <view class="page-section-title">my.multiLevelSelect</view>
        <view class="page-section-demo">
            <button type="primary" onTap="openMultiLevelSelect">Cascade
            selector</button>
        </view>
    </view>
</view>
```

copy

```
//.js
Page({
    openMultiLevelSelect() {
        my.multiLevelSelect({
            title: 'Cascade selector',//Cascade selector title
            list: [
                {
                    name: "City",//entry name\
                    subList: [\
```

```

{\ \
    name: "District A", \
    subList: [\ \
        {\ \
            name: "Street A"\ \
        }, \
        {\ \
            name: "Street B"\ \
        }\ \
    }, \
    {\ \
        name: "District B", \
        subList: [\ \
            {\ \
                name: "Street C"\ \
            }, \
            {\ \
                name: "Street D"\ \
            }\ \
        ], \
        ]// cascade sub-data list\
    }], // Cascade data list
    success:(res)=>{
        my.alert({title:JSON.stringify(res)})
    }
}); \
}
})

```

Parameters

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | No | Title. || list | JSONArray | Yes | Selection data list. || name | String | Yes | Entry name. || subList | JSONArray | No | Sub-entry list. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || success | Boolean | Selection completed or not, returning `false` for cancellation. || result | JSONArray | Selection result, such as `[{"name":"City"}, {"name":"District A"}, {"name":"Street A"}]`. |

my.navigateBack

2022-07-03 18:44

Close the current page and return to the previous one or more pages. It is possible to use `getCurrentPages` to get the current page stack information and decide how many levels to return.

Sample Code

copy

```
// Note: When calling navigateTo API, the page that called the method  
// will be added to the stack.  
  
// This is the page one  
my.navigateTo({  
    url: 'two?pageId=10000'  
})  
  
// This is the page two  
my.navigateTo({  
    url: 'one?pageId=99999'  
})  
  
// navigateBack in page three , will return page one  
my.navigateBack({  
    delta: 2  
})
```

Parameters

Property	Type	Default	Description
delta	Number	1	Number of pages to return. If delta is greater than the number of open pages, it returns to the home page.

my.navigateBackMiniProgram {#mynavigatebackminiprogram}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.navigateBackMiniProgram

2022-07-03 18:44

Return to the previous Mini Program. Only used for when another Mini Program jumps back to the foregrounded Mini Program.

Sample Code

copy

```
my.navigateBackMiniProgram({
  extraData: {
    "data1": "test"
  },
  success: (res) => {
    console.log(JSON.stringify(res))
  },
  fail: (res) => {
    console.log(JSON.stringify(res))
  }
});
```

Parameters

Property	Type	Required	Description
extraData	Object	No	The extra data that needs to be returned to the target Mini Program, and the target Mini Program can get it in <code>App.onLaunch()</code> or <code>App.onShow()</code> .
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

my.navigateTo {#mynavigateto}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.navigateTo

2021-05-09 18:43

Maintain the current page and jump to the specified page within the application. Use `my.navigateBack` to return to the original page.

Note: The maximum page depth is 10. In other words, the `navigateTo` can be called 10 times at most.

Sample Code

copy

```
my.navigateTo({
  url: 'new_page?count=100'
})

Page({
  onLoad(query) {
    my.alert({
      content: JSON.stringify(query),
    });
  }
})
```

Parameters

Property	Type	Required	Description
url	String	Yes	The application for the jumping does not include the destination page path of the tabBar. The path can be followed by parameters. Rules for the parameters: The path and parameter are separated with ?, the parameter key and the parameter value are connected with =, and different parameters must be separated with &, such as path?key1=value1&key2=value2. success Function No Callback function upon call success. fail Function No Callback function upon call failure. complete Function No Callback function upon call completion (to be executed upon either call success or failure).

my.navigateToMiniProgram {#mynavigatetominiprogram}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.navigateToMiniProgram

2021-05-09 18:43

Jump to another Mini Program.

Sample Code

copy

```
my.navigateToMiniProgram({
  appId: 'xxxx',
  extraData:{
    "data1":"test"
  },
  success: (res) => {
    console.log(JSON.stringify(res))
  },
  fail: (res) => {
    console.log(JSON.stringify(res))
  }
});
```

Parameters

Property	Type	Required	Description
appId	String	Yes	The appId of the target Mini Program to jump to.
path	String	No	The path of the target Mini Program to jump to, open the homepage if it is empty.
extraData	Object	No	The extra data that needs to be passed to the target Mini Program, and the target Mini Program can get it in App.onLaunch() or App.onShow().
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Last updated: 2022-07-03

Path: miniprogram_gcash

my.notifyBLECharacteristicValueChange

2022-07-03 18:44

Use this API enable notification on change of Bluetooth Low Energy (BLE) device characteristics.

Instructions:

- The device characteristics must support `notify` or `indicate` to use this API. See properties in [my.getBLEDeviceCharacteristics](#) for details.
- You must enable this API first before you can use [my.onBLECharacteristicValueChange](#).
- After a successful subscription, the device must actively update the value of the characteristic to trigger [my.onBLECharacteristicValueChange](#).
- Subscription is more efficient and is recommended over the read method.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
my.notifyBLECharacteristicValueChange({  
    deviceId: deviceId,  
    serviceId: serviceId,  
    characteristicId: characteristicId,  
    success: (res) => {  
        console.log(res)  
    },  
    fail:(res) => {  
    },  
    complete: (res)=>{  
    }  
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || deviceId | String | Yes | The Bluetooth device ID. || serviceId | String | Yes | The UUID of the service corresponding to a Bluetooth characteristic. || characteristicId | String | Yes | The Bluetooth characteristic UUID. || descriptorId | String | No | Descriptor UUID of the notification. This is Android-specific, the default value is 00002902-0000-10008000-00805F9b34fb. || state | Boolean | No | Whether `notify` or `indicate` is enabled. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.offAccelerometerChange

2021-05-09 18:43

Use this API to stop listening to acceleration data event.

Sample Code

copy

```
my.offAccelerometerChange();
```

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```
my.offAccelerometerChange();
```

- If the callback value is passed, only the corresponding callback is removed. The sample code is as follows:

copy

```
my.offAccelerometerChange(this.callback);

2022-07-03 18:44

Use this API to unlisten to the BLE device characteristic change event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
Page({
  onLoad() {
    this.callback = this.callback.bind(this);
    my.onBLECharacteristicValueChange(this.callback);
  },
  onUnload() {
    my.offBLECharacteristicValueChange(this.callback);
  },
  callback(res) {
    console.log(res);
  },
})
```

Parameters

		---		---		---		Property		Type		Description		deviceId		String		The Bluetooth device ID.		serviceId		String		The UUID of the service corresponding to a Bluetooth characteristic.		characteristicId		String		The Bluetooth device characteristic UUID.		value		Hex String		The latest hexadecimal value of the characteristic.	
--	--	-----	--	-----	--	-----	--	----------	--	------	--	-------------	--	----------	--	--------	--	--------------------------	--	-----------	--	--------	--	--	--	------------------	--	--------	--	---	--	-------	--	------------	--	---	--

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```
my.offBLECharacteristicValueChange();
```

- If the callback value is passed, only the corresponding callback is removed. The sample code is as follows:

copy

```
my.offBLECharacteristicValueChange(this.callback);
```

my.offBLEConnectionStateChanged

2022-07-03 18:44

Use this API to unlisten to the Bluetooth Low Energy (BLE) connection status change event.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

my.offBLEConnectionStateChanged

2021-05-09 18:43

Use this API to unlisten to the Bluetooth Low Energy (BLE) connection status change event.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

```

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```
my.offBLEConnectionStateChanged();
```

- If the callback value is passed, only the corresponding callback is removed. The sample code is as follows:

copy

```
my.offBLEConnectionStateChanged(this.callback);
```

my.offBluetoothAdapterStateChange

2021-05-09 18:43

Use this API to remove the bluetooth adapter with a state change.

In order to prevent multiple callbacks of an event, which are resulted from multiple registered event listeners, it is recommended to call off method to listen for an event and close the previous event listener, before you call on method.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Code Sample

copy

```
my.offBluetoothAdapterStateChange();
```

Transmitting Callback Values

- If you don't transmit the callback value, all the event listener callbacks will be removed. See the below code sample for more information:

copy

```
my.offBluetoothAdapterStateChange();
```

- If you transmit the callback value, the corresponding callbacks will be removed. See the below code sample for more information:

copy

```
my.offBluetoothAdapterStateChange(this.callback);
```

my.onError {#myofferror}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.offError

2022-07-03 18:44

Unlisten for the event that JS errors occur in the mini program.

Sample code

copy

```
// .js
App({
  onShow() {
    this.handleError = error => {
      // Errors occur when running the mini program.
      console.log(error);
    }
    // The type of error is String.
    my.onErrorHandler(this.handleError);
  },
  onHide() {
    // Unlisten for the event that JS errors occur in the mini
    // program.
    my.offErrorHandler(this.handleError);
  }
})
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || callback | Function | The callback function for the event that JS errors occur in the mini program. |

```

        my.alert({
            title: 'Client version is too low',
            content: 'my.onMemoryWarning() and my.offMemoryWarning() need
10.1.35 or higher versions'
        });
    },
    onUnload() {
        if (this.isApiAvailable) {
            my.offMemoryWarning(this.callback);
        }
    }
});

```

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```
my.offMemoryWarning();
```

- If the callback value is passed, only the corresponding callback is removed. The sample code is as follows:

copy

```
my.offMemoryWarning(this.callback);
```

my.offMemoryWarning

2021-05-09 18:43

Use this API to unlisten to the insufficient memory alarm event. Ensure that the parameter (callback) is the same object as the one in [onMemoryWarning](#).

Sample Code

copy

```
// API-DEMO page/API/memory-warning/memory-warning.json
{
    "defaultTitle": "OnMemoryWarning"
}
```

copy

```
<!-- API-DEMO page/API/memory-warning/memory-warning.axml-->
<view class="page">

    <button type="primary" onTap="onMemoryWarning">
        Listen to Insufficient Memory Alarm Event
    </button>

</view>
```

copy

```
// API-DEMO page/API/memory-warning/memory-warning.js
Page({
    onLoad() {
        this.callback = (res) => {
            var levelString = 'iOS device, No alarm level exists.';
            switch (res.level) {
                case 10:
                    levelString = 'Android device, level = TRIM_MEMORY_RUNNING_LOW';
                    break;
                case 15:
                    levelString = 'Android device, level = TRIM_MEMORY_RUNNING_CRITICAL';
                    break;
            }
            my.alert({
                title: 'Received insufficient memory alarm',
                content: levelString
            });
        };
        this.isApiAvailable = my.canIUse('onMemoryWarning');
    },
    onMemoryWarning() {
        if (this.isApiAvailable) {
            my.onMemoryWarning(this.callback);
        } else {
            my.alert({
                title: 'Client version is too low',
                content: 'my.onMemoryWarning() and my.offMemoryWarning() need 10.1.35 or higher versions'
            });
        }
    }
});
```

```

        });
    }
},
onUnload() {
    if (this.isApiAvailable) {
        my.offMemoryWarning(this.callback);
    }
}
);

```

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```
my.offMemoryWarning();
```

- If the callback value is passed, only the corresponding callback is removed. The sample code is as follows:

copy

```
my.offMemoryWarning(this.callback);
```

my.offSocketClose

2022-07-03 18:44

Use this API to unlisten to the event of disabling the WebSocket connection.

Sample Code

copy

```
Page({
  onLoad() {
    my.onSocketClose(this.callback);
  },
  onUnload() {
    my.offSocketClose(this.callback);
    // my.offSocketClose();
  },
  callback(res) {
    my.alert({content: 'The connection is disabled!'});
    this.setData({
      sendMessageAbility: false,
      closeLinkAbility: false,
    });
  },
})
```

Note: The case is only for reference. Please use your own URL to test.

Whether to pass callback value or not

- If the callback value is not passed, the callbacks of all events will be removed. The sample code is as follows:

copy

```

Last updated: 2022-07-03

Path: miniprogram_gcash

my.offUnhandledRejection

2022-07-03 18:44

Unlisten for the *unhandledrejection* event.

Sample code

copy

```
//.js
App({
  onShow(options) {
    const handleRejection = (res) => {
      console.log(res.reason);
      console.log(res.promise);
    }
    my.onUnhandledRejection(handleRejection);
    my.offUnhandledRejection(handleRejection);
  }
})
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || callback | Function |

The *unhandledrejection* event is triggered when a JavaScript Promise that has no rejection handler is rejected. |

my.offUserCaptureScreen {#myoffusercapturescreen}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.offUserCaptureScreen

2022-07-03 18:44

Cancel screen capture listener event. This is usually paired with my.onUserCaptureScreen.

Sample Code

copy

```
<!-- API-DEMO page/API/user-capture-screen/user-capture-screen.axml-->
<view class="page">
    <view class="page-description">User screen capture event API</view>
    <view class="page-section">
        <view class="page-section-title">my.onUserCaptureScreen</view>
        <view class="page-section-demo">
            <view>Current status: {{ condition ? "listening on" : 'Listening off' }}</view>
            <view a:if="{{condition}}">
                <button type="primary" onTap="offUserCaptureScreen">Cancel screen capture listening event</button>
            </view>
            <view a:else>
                <button type="primary" onTap="onUserCaptureScreen">Turn on screen capture listening event</button>
            </view>
        </view>
    </view>
</view>
```

copy

```
// API-DEMO page/API/user-capture-screen/user-capture-screen.js
Page({
  data: {
    condition: false,
  },
  onReady() {
    my.onUserCaptureScreen(() => {
      my.alert({
        content: 'Received user screen capture',
      });
    });
  },
  offUserCaptureScreen() {
    my.offUserCaptureScreen();
    this.setData({
      condition: false,
    });
  },
  onUserCaptureScreen() {
    my.onUserCaptureScreen(() => {
      my.alert({
        content: 'Received user screen capture'
      });
    });
    this.setData({
      condition: true,
    });
  },
});
```

Dismissing Callback

- If you need to remove all event listener callback. Sample code:

copy

```
my.offUserCaptureScreen();
```

- If you need to remove a specific callback event. Sample code:

copy

```
my.offUserCaptureScreen(this.callback);
```

my.onAccelerometerChange

2022-07-04 03:44

Use this API to listen to the acceleration data event. The callback interval is 500ms. After the interface is called, the listening is automatically started. You can use [my.offAccelerometerChange](#) to stop listening.**

Sample Code

copy

```
my.onAccelerometerChange(function(res) {
  console.log(res.x);
  console.log(res.y);
  console.log(res.z);
})
```

Parameters

The property is a callback function which uses object properties with the following property:

Property	Type	Description
x	Number	x-axis
y	Number	y-axis
z	Number	z-axis

my.onAppHide

2022-07-03 18:44

Listen for the event that the mini program is switched to background from foreground. The triggered time of the API is the same with that of the [onHide\(\) method](#). To unlisten for the event that the mini program is switched to background from foreground, see [my.offAppHide](#).

Sample code

.axml

copy

```
<!-- .axml-->
<button size="default" onTap="offAppHideHanlder"
```

```
type="primary">Unlisten for the event tha the mini program is switched  
to background</button>
```

.js

copy

```
//.js  
onLoad() {  
    my.onAppHide(this.onAppHideHandler)  
},  
// The method of listening for the event that the mini program is  
switched to background  
onAppHideHandler() {  
    console.log('The method of listening for the event that the mini  
program is switched to background')  
},  
// The method of unlistening for the event that the mini program is  
switched to background  
offAppHideHanlder() {  
    my.offAppHide(this.onAppHideHandler)  
},
```

Parameters

The parameter is in object type and has the following property:

--- --- ---	Property	Type	Description	callback Function The callback function for the event that the mini program is switched to background.

my.onBLECharacteristicValueChange {#myonblecharacteristicvaluechange}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.onBLECharacteristicValueChange

2022-07-03 18:44

Use this API to listen to the Bluetooth Low Energy (BLE) device characteristic change event.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

my.onBLECharacteristicValueChange

2021-05-09 18:43

Use this API to listen to the Bluetooth Low Energy (BLE) device characteristic change event.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

my.onBLEConnectionStateChanged

2022-07-03 18:44

Use this API to listen to the Bluetooth Low Energy (BLE) connection error event, including device loss and unusual disconnections.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

my.onBLEConnectionStateChanged

2021-05-09 18:43

Use this API to listen to the Bluetooth Low Energy (BLE) connection error event, including device loss and unusual disconnections.

Instruction:

It is recommended that you call the `off` method and close event listening before you call the `on` method to listen events to prevent the situation where multiple listening event cause multiple callbacks of an event.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Parameters

Property	Type	Description
deviceID	String	The Bluetooth device ID.
connected	Boolean	The current connection state.

Success Callback Function

The input parameters are displayed in the following table:

		Property	Type	Description
	---	--- ---	discovering	Boolean Indicates whether bluetooth device is being discovered.
	---	---	available	Boolean Indicates whether bluetooth is available (BLE should be supported and switched on).

Success Callback Function

The input parameters are displayed in the following table:

Property	Type	Description
discovering	Boolean	Indicates whether bluetooth device is being discovered.
available	Boolean	Indicates whether bluetooth is available (BLE should be supported and switched on).

my.onBluetoothDeviceFound

2021-05-09 18:43

Use this API when a new Bluetooth device is found.

Instructions:

- You may not get the `advertisData` and `RSSI` in the emulator. Please debug in the guest.
- For Integrated Development Environment (IDE) and Android devices, the device ID is the MAC address of the device; for iOS devie, the device ID is the UUID of the device. Therefore, do not hard code the device ID. You need to process the device ID on different platforms; iOS devices can be dynamically matched based on properties such as `localName`, `advertisData`, and `manufacturerData`.
- If the API `my.onBluetoothDeviceFound` callback contains a bluetooth device, the device is added to the array obtained by the API [my.getBluetoothDevices](#) .

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Success Callback Function

The input parameters are displayed in the following table:

||||| --- | --- | --- || **Property** | **Type** | **Description** || devices | Array | A list of all the devices that are newly discovered. |

Device Object

||||| --- | --- | --- || **Property** | **Type** | **Description** || name | String | Name of the bluetooth device.(For some devices, there's no name.) || deviceName (Compatible with initial version) | String | Name of the bluetooth device. || localName | String | Name of the local device. || deviceId | String | Device ID. || RSSI | Number | Received Signal Strength Indicator. || advertisData | Hex String | Advertisement data of the device. |

my.onBluetoothDeviceFound

2022-07-03 18:44

Use this API when a new Bluetooth device is found.

Instructions:

- You may not get the advertisData and RSSI in the emulator. Please debug in the guest.
- For Integrated Development Environment (IDE) and Android devices, the device ID is the MAC address of the device; for iOS devie, the device ID is the UUID of the device. Therefore, do not hard code the device ID. You need to process the device ID on different platforms; iOS devices can be dynamically matched based on properties such as localName, advertisData, and manufacturerData.
- If the API my.onBluetoothDeviceFound callback contains a bluetooth device, the device is added to the array obtained by the API [my.getBluetoothDevices](#) .

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Success Callback Function

The input parameters are displayed in the following table:

||||| --- | --- | --- | **Property** | **Type** | **Description** || devices | Array | A list of all the devices that are newly discovered. |

Device Object

||||| --- | --- | --- | **Property** | **Type** | **Description** || name | String | Name of the bluetooth device.(For some devices, there's no name.) || deviceName (Compatible with initial version) | String | Name of the bluetooth device. || localName | String | Name of the local device. || deviceId | String | Device ID. || RSSI | Number | Received Signal Strength Indicator. || advertisData | Hex String | Advertisement data of the device. |

my.onCompassChange {#myoncompasschange}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.onCompassChange

2022-07-03 18:44

Use this API to listen to the compass data change event. After the interface call, listening is automatically started. The callback interval is 500ms. You can use [my.offCompassChange](#) to stop listening.

Sample Code

copy

```
my.onCompassChange(function (res) {
  console.log(res.direction);
})
```

Parameters

The property is a callback function which uses object properties with the following property:

||||| --- | --- | --- | **Property** | **Type** | **Description** || direction | Number | The degree of the direction that you are facing. |

my.onError {#myonerror}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.onError

2022-07-03 18:44

Listen for the event that errors occur in the mini program. Currently only JS errors are supported. The triggered time and required parameters are the same with those of the [onError\(\) method](#).

Sample code

Sample for general errors:

copy

```
// .js
App({
  onLaunch() {
    // Type of error is String.
    my.onError(function(error) {
      // Errors occur when running the mini program.
      console.error(error);
    });
  }
})
```

Sample for JS errors:

copy

```
onShow: function() {

  // Errors occur when running the mini program.
  my.onError(function(error) {
    // Error message displayed on the page
    console.warn(error, '1212');
  });
}
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || callback | Function | The callback function for the event that JS errors occur in the mini program. |

Returned value

||||| --- | --- | --- || **Property** | **Type** | **Description** || error | String | Error message. |

my.onMemoryWarning {#myonmemorywarning}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.onMemoryWarning

2022-07-03 18:44

Use this API to listen to the insufficient memory alarm event.

For Android, two alarm levels exist:

- TRIM_MEMORY_RUNNING_LOW
- TRIM_MEMORY_RUNNING_CRITICAL

No alarm level is available for iOS.

Sample Code

copy

```
// API-DEMO page/API/memory-warning/memory-warning.json
{
    "defaultTitle": "OnMemoryWarning"
}
```

copy

```
<!-- API-DEMO page/API/memory-warning/memory-warning.axml-->
<view class="page">

    <button type="primary" onTap="onMemoryWarning">
        Listen to Insufficient Memory Alarm Event
    </button>

</view>
```

copy

```
// API-DEMO page/API/memory-warning/memory-warning.js
Page({
    onLoad() {
```

```

        this.callback = (res) => {
            var levelString = 'iOS device, No alarm level exists.';
            switch (res.level) {
                case 10:
                    levelString = 'Android device, level =
TRIM_MEMORY_RUNNING_LOW';
                    break;
                case 15:
                    levelString = 'Android device, level =
TRIM_MEMORY_RUNNING_CRITICAL';
                    break;
            }
            my.alert({
                title: 'Received insufficient memory alarm',
                content: levelString
            });
        };
        this.isApiAvailable = my.canIUse('onMemoryWarning');
    },
    onMemoryWarning() {
        if (this.isApiAvailable) {
            my.onMemoryWarning(this.callback);
        } else {
            my.alert({
                title: 'Client version is too low',
                content: 'my.onMemoryWarning() and my.offMemoryWarning() need
10.1.35 or higher versions'
            });
        }
    },
    onUnload() {
        if (this.isApiAvailable) {
            my.offMemoryWarning(this.callback);
        }
    }
);

```

Parameters

The property is a callback function which uses object properties with the following property:

Property	Type	Description
level	Number	Memory alarm level, only available in Android.

Android alarm levels that correspond to the system macro definitions:

copy

```

int TRIM_MEMORY_RUNNING_LOW = 10
int TRIM_MEMORY_RUNNING_CRITICAL = 15

```

Callback Return Value

		Property	Type	Description	
		data	String / ArrayBuffer	Messages returned by the server, in text string or base64 encoded string.	isBuffer

Boolean | If the value of this field is true, the data field represents the received base64 encoded binary strings. If the value of this field is empty, the data field represents normal strings.

Sample Code

copy

```
my.connectSocket({
  url: 'Server URL'
})

my.onSocketMessage(function(res) {
  console.log('Server content received ' + res.data)
})
```

Note: The case is only for reference. Please use your own URL to test.

my.onSocketMessage

2021-05-09 18:43

Use this API to listen to the event of receiving server messages by WebSocket.

Callback Return Value

Property	Type	Description
data	String / ArrayBuffer	Messages returned by the server, in text string or base64 encoded string.
isBuffer	Boolean	If the value of this field is true, the data field represents the received base64 encoded binary strings. If the value of this field is empty, the data field represents normal strings.

Sample Code

copy

```
my.connectSocket({
  url: 'Server URL'
})

my.onSocketMessage(function(res) {
  console.log('Server content received ' + res.data)
})
```

Note: The case is only for reference. Please use your own URL to test.

my.onSocketOpen

2022-07-03 18:44

Use this API to listen to the event of enabling the WebSocket connection.

Sample Code

copy

```
my.connectSocket({  
    url: 'test.php',  
});  
  
my.onSocketOpen(function(res) {  
    console.log('The WebSocket connection is enabled!');  
});
```

Note: The case is only for reference. Please use your own URL to test.

Parameters

--- --- --- ---	Property	Type	Required	Description	callback Function
Yes	The callback function for the event of enabling the WebSocket connection.

my.onUnhandledRejection {#myonunhandledrejection}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.onUnhandledRejection

2022-07-03 18:44

Listen for the *unhandledrejection* event. The *unhandledrejection* event is triggered when a JavaScript Promise that has no rejection handler is rejected. The triggered time of the callback for the *unhandledrejection* event and required parameters are the same with those of the [onUnhandledRejection\(\)](#) method.

Sample code

copy

```
//.js
App({
  onShow(options) {
    my.onUnhandledRejection((res) => {
      console.log(res.reason);
      console.log(res.promise);
    });
  }
})
```

Parameters

Property	Type	Description
callback	Function	The <i>unhandledrejection</i> event is triggered when a JavaScript Promise that has no rejection handler is rejected.

Callback function

Property	Type	Description
reason	String	Rejection reason, which usually is the error object.
promise	Promise	The rejected Promise object.

my.onUserCaptureScreen

2022-07-03 18:44

my.onUserCaptureScreen

Listen to the user-initiated active screen capture event. This will receive all the screen capture event notification of the system or a third-party tool.

Sample Code

copy

```
<!-- API-DEMO page/API/user-capture-screen/user-capture-screen.axml-->

my.openBluetoothAdapter {#myopenbluetoothadapter}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.openBluetoothAdapter

2022-07-03 18:44

Use this API to initialize the Bluetooth module in the mini program. You can call the following mini program API and receive event callbacks that are related to the Bluetooth module in the effective period when you call the API `my.openBluetoothAdapter` is called. The effective period is ended when the API `my.closeBluetoothAdapter` is called.

Instructions :

- If you call other APIs in the bluetooth module before you call the API `my.openBluetoothAdapter` you get the following error:
 - Error Code: 10000
 - Error Description: The Bluetooth adapter is not initialized.
 - Solution: call the API `my.openBluetoothAdapter`
- When users do not switch on the Bluetooth or the Bluetooth function is not supported on the user's mobile phone, an error is returned after you call the API `my.openBluetoothAdapter`. For more information about error codes, see the error code table. After the Bluetooth module is initialized, you can use the API `my.onBluetoothAdapterStateChange` to monitor changes of the Bluetooth status.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

		Property	Type	Required	Description	autoClose
Boolean	No	Indicates whether to automatically disconnect Bluetooth when you leave the current page. The default value is true. Note : Only Android is supported.			success Function No The callback function for a successful API call.	fail Function No The callback function for a failed API call.
					complete Function No The callback function for a completed API call (Regardless of whether the call is successful or not).	

Success Callback Function

The input parameters are displayed in the following table:

		Property	Type	Description	isSupportBLE	Boolean	Indicates whether BLE is supported.

Error Code

The input parameters are displayed in the following table:

		Error Code	Description	Solution
1	1	12	Bluetooth is not turned on.	Try again to turn on Bluetooth.
1	2	13	Connection to the system service is temporarily lost.	Try again to reconnect.
1	3	14	Not authorized to use Bluetooth.	Authorize app to use Bluetooth.
1	4	15	Unknown error.

my.openBluetoothAdapter

2021-05-09 18:43

Use this API to initialize the Bluetooth module in the mini program. You can call the following mini program API and receive event callbacks that are related to the Bluetooth module in the effective period when you the API `my.openBluetoothAdapter` is called. The effective period is ended when the API `my.closeBluetoothAdapter` is called.

Instructions :

- If you call other APIs in the bluetooth module before you call the API `my.openBluetoothAdapter` you get the following error:
 - Error Code: 10000
 - Error Description: The Bluetooth adapter is not initialized.
 - Solution: call the API `my.openBluetoothAdapter`
 - When users do not switch on the Bluetooth or the Bluetooth function is not supported on the user's mobile phone, an error is returned after you call the API `my.openBluetoothAdapter`. For more information about error codes, see the error code table. After the Bluetooth module is initialized, you can use the API `my.onBluetoothAdapterStateChange` to monitor changes of the Bluetooth status.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

            my.alert({ content: JSON.stringify(error) });
          } else {
            my.alert({ content: 'Changes of connection state ' +
              JSON.stringify(res) });
          }
        },
        offBLEConnectionStateChanged() {

          my.offBLEConnectionStateChanged(this.getBind('onBLEConnectionStateChanged'));
          onUnload() {
            this.offBLEConnectionStateChanged();
            this.offBLECharacteristicValueChange();
            this.offBluetoothAdapterStateChange();
            this.closeBluetoothAdapter();
          },
        });
      };
    };
  };
};
```

Parameters

The input parameters are displayed in the following table:

	Property	Type	Required	Description
	autoClose	Boolean	No	Indicates whether to automatically disconnect Bluetooth when you leave the current page. The default value is true. Note : Only Android is supported.
	success	Function	No	The callback function for a successful API call.
	fail	Function	No	The callback function for a failed API call.
	complete	Function	No	The callback function for a completed API call (Regardless of whether the call is successful or not).

Success Callback Function

The input parameters are displayed in the following table:

	Property	Type	Description
	isSupportBLE	Boolean	Indicates whether BLE is supported.

Error Code

The input parameters are displayed in the following table:

	Error Code	Description	Solution
	12	Bluetooth is not turned on.	Try again to turn on Bluetooth.
	13	Connection to the system service is temporarily lost.	Try again to reconnect.
	14	Not authorized to use Bluetooth.	Authorize app to use Bluetooth.
	15	Unknown error.

my.openDocument {#myopendocument}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.openDocument

2021-05-09 18:43

The my.openDocument API enables users to preview a PDF file within the mini program.

After clicking on the PDF file, the user can preview the file without leaving the mini program. After closing the preview, the user will still be at the current mini program page.

Sample code

.js

copy

```
// .js
my.downloadFile({
    // Sample url that is not real
    url: 'http://documentExample.com/alipay.pdf',
    success({ apFilePath }) {
        my.hideLoading();
        my.openDocument({
            filePath: apFilePath,
            fileType: 'pdf',
            success: (res) => {
                console.log('open document success')
            }
        })
    }
})
```

Parameters

Object type

	Property	Type	Required	Description
filePath	String			file path
url	String	Yes		Obtain file path via <code>my.downloadFile</code> .
fileType	String			File type.
success	Function			Callback function upon call success.
fail	Function	No		Callback function upon call failure.
complete	Function	No		Callback function upon call completion (to be executed upon either call success or failure).

Legal values for fileType

	Value	Description
pdf	PDF format.	

Error code

	Error code	Description	Solution
4011	File path is invalid or no permission to access incoming path.	Check the incoming file path.	
4012	Preview files do not exist.	Make sure files that correspond to file path exist.	
4013	File format is not supported.	Currently preview of PDF files is supported.

my.openSetting {#myopensetting}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.openSetting

2021-05-09 18:43

Use this API to open the Mini Program settings page and returns permission setting results. Only the permissions that have been requested by the Mini Program from the user are displayed on the settings page.

Sample Code

copy

```
my.openSetting({
  success: (res) => {
    /*
     * res.authSetting = {
     *   "userInfo": true,
     *   "location": true,
     *   ...
     * }
     */
  }
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Success callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || authSetting | Object | Results of user authorization. Keys are the values of scopes and values are boolean types, which shows whether the user gives the permission or not. See Scopes for details. |

Scopes

||||| --- | --- | --- || **Scope** | **API** | **Description** || location | my.getLocation | This field specifies whether to authorize access to geographic location. || album | my.chooseImage, my.saveImage | This field specifies whether to authorize to save images to the albums. || camera | my.scan | This field specifies whether to authorize access to camera. || userInfo | my.getOpenUserInfo | This field specifies whether to authorize access to user information. |

my.pageScrollTo {#mypagescrollto}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.pageScrollTo

2021-05-09 18:43

Scroll to the target position on the page

Note:

- The scrollTop has a higher priority than selector.

- When the my.pageScrollTo is used to jump to the top of the Mini Program, the scrollTop value must be set as a number greater than 0 to make jump possible.

Sample Code

copy

```
<!-- .axml -->
<view class="page">
    <view class="page-description">Page scroll API</view>

    <view class="page-section">
        <view class="page-section-title">
            my.pageScrollTo
        </view>
        <view class="page-section-demo">
            <input type="text" placeholder="key" name="key" value="{{scrollTop}}" onInput="scrollTopChange"></input>
        </view>
        <view class="page-section-btns">
            <view onTap="scrollTo">Page scroll </view>
        </view>
    </view>

    <view style="height:1000px"/>
</view>
```

copy

```
//.js
Page({
    data: {
        scrollTop: 0,
    },
    scrollTopChange(e) {
        this.setData({
            scrollTop: e.detail.value,
        });
    },
    onPageScroll({ scrollTop }) {
        console.log('onPageScroll', scrollTop);
    },
    scrollTo() {
        my.pageScrollTo({
            scrollTop: parseInt(this.data.scrollTop),
            duration: 300,
        });
    },
});
```

Parameters

Object type with the following attributes:

Property	Type	Default	Required	Description
scrollTop Number - No Scroll to the target position on the page, in px When the my.pageScrollTo is used to jump to the top of the Mini Program, the scrollTop value must be set as a number greater than 0 to make jump possible.	duration Number 0 No Duration of scroll animation, in ms.	selector string - No Selector.	success Function - No Callback function upon call success.	fail Function - No Callback function upon call failure.

Selector Syntax

When the selector parameter is transferred, the framework executes document.querySelector(selector) to select the target node.

  cancelButtonText: 'Cancel',
  success: (result) => {
    my.alert({
      title: JSON.stringify(result),
    });
  },
});
```

Parameters

Property	Type	Required	Description
title	String No		Title of prompt box.
message	String Yes		Text of prompt box, which is “Enter contents here” by default.
placeholder	String No		Prompt text for the entry box.
align	String No		Message alignment. Valid values are: - left

- center
- right

The default value is `center` for both iOS and Android. || `okButtonText` | String | No | OK button text, which is **OK** by default. || `cancelButtonText` | String | No | Cancel button text, which is **Cancel** by default. || `success` | Function | No | Callback function upon call success. || `fail` | Function | No | Callback function upon call failure. || `complete` | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || `ok` | Boolean | Click OK to return true; click Cancel to return false. || `inputValue` | String | When OK is true, return the user's entry. |

my.prompt {#myprompt}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.prompt

2022-07-03 18:44

Pop up a dialog to show the prompt message.

Sample Code

copy

```
my.prompt({
  title: 'Title',
  message: 'Explain the current status and prompt the user solution.
It is best not to exceed two lines.',
  placeholder: 'Leave a message to a friend',
  okButtonText: 'Confirm',
  cancelButtonText: 'Cancel',
  success: (result) => {
    my.alert({
      title: JSON.stringify(result),
```

```
    });
  },
});
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | No | Title of prompt box. || message | String | Yes | Text of prompt box, which is “Enter contents here” by default. || placeholder | String | No | Prompt text for the entry box. || align | String | No | Message alignment. Valid values are:

- left
- center
- right

The default value is **center** for both iOS and Android. || okButtonText | String | No | OK button text, which is **OK** by default. || cancelButtonText | String | No | Cancel button text, which is **Cancel** by default. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** || ok | Boolean | Click OK to return true; click Cancel to return false. || inputValue | String | When OK is true, return the user's entry. |

my.reLaunch

2022-07-03 18:44

Close page stacks and jump to the specified page within the application.

Sample Code

copy

```
my.reLaunch({
  url: '/page/index'
})
```

Parameters

Property | Type | Required | Description | url | String | Yes |
 Page path If the page is not a tabbar page, the path can be followed by parameters. Rules
 for the parameters: The path and parameter are separated with
 ?
 , the parameter key and the parameter value are connected with
 =
 , and different parameters must be separated with
 &
 , such as
 path?key1=value1&key2=value2
 . || success | Function | No | Callback function upon call success. || fail | Function | No |
 Callback function upon call failure. || complete | Function | No | Callback function upon
 call completion (to be executed upon either call success or failure). |

my.readBLECharacteristicValue {#myreadblecharacteristicvalue}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.readBLECharacteristicValue

2022-07-03 18:44

Use this API to read the data of Bluetooth Low Energy (BLE) device characteristics. The returned information must be obtained by using the callback in the [my.onBLECharacteristicValueChange](#).

Instructions:

- The device characteristics must support read to use this API. See properties in [my.getBLEDeviceCharacteristics](#) for details.
- Multiple parallel reading and writing calls might cause failures.
- If the reading times out, the error code is 10015. However, [my.onBLECharacteristicValueChange](#) interface might return data later. Please consider how to handle this situation.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
my.readBLECharacteristicValue({
  deviceId: deviceId,
  serviceId: serviceId,
  characteristicId: characteristicId,
  success: (res) => {
    console.log(res)
  },
  fail:(res) => {
  },
  complete: (res)=>{
  }
})
```

Parameters

Property	Type	Required	Description
deviceId	String	Yes	The Bluetooth device ID.
serviceId	String	Yes	The UUID of the service corresponding to a Bluetooth characteristic.
characteristicId	String	Yes	The Bluetooth characteristic UUID.
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails.

Success Callback Function

Property	Type	Description
characteristic	Object	Information of the device characteristic.

characteristic

Information of the Bluetooth device characteristic

Property	Type	Description
characteristicId	String	The Bluetooth characteristic UUID.
serviceId	String	The UUID of the service corresponding to a Bluetooth characteristic.
value	Hex String	The Bluetooth characteristic value.

my.request {#myrequest}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.request

2022-07-03 18:44

Network request of a Mini Program.

Notes

1. Configure the domain name whitelist at first under **Mini Program > Configuration > Server Domain Whitelist**. The Mini Program can only communicate with the domain names in the whitelist during the API calls: `my.request` (send HTTP request), `my.uploadFile` (upload file), and `my.downloadFile` (download file).
2. During the Mini Program development, in the developer tool, select whether to ignore the `httpRequest` domain name validity check under **Details > Domain name information**. If yes, the domain name validity will not be checked in the simulator, preview, and real machine debugging scenarios. However, before the Mini Program goes online, you must maintain the domain names in the whitelist, otherwise, the domain names cannot be effective in the official release.

Important: `my.request` request header is `{'content-type': 'application/json'}` by default, instead of `{'content-type': 'application/x-www-form-urlencoded'}`.

Sample Code

copy

```
my.request({
  url: 'https://httpbin.org/post',
  method: 'POST',
  data: {
    from: 'Mini Program',
    production: 'JSAPI',
  },
  dataType: 'json',
  success: function(res) {
    my.alert({content: 'success'});
  },
  fail: function(res) {
    my.alert({content: 'fail'});
  },
  complete: function(res) {
```

```

        my.hideLoading();
        my.alert({content: 'complete'});
    }
});

const task = my.request({url: 'https://httpbin.org/post'})
task.abort()

```

Parameters

||||| --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | url | String | Yes | Target server url. | headers | Object | No | Set the request HTTP header. The default value is

```
{
  'content-type': 'application/json'
}
```

. | method | String | No | The default value is GET. Both GET and POST are supported. | data | Object | No | Request parameter. | timeout | Number | No | Timeout period in ms. The default value is 30000. | dataType | String | No | Expected format of the returned data. The following formats are supported:

- json
- text
- base64

The default format is json. | success | Function | No | The callback function for a successful API call. | fail | Function | No | The callback function for a failed API call. | complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Data Parameter Description

Data transferred to the server is eventually expressed in String. If the type is not String, the data will be converted into String. Conversion rules are:

- If the method is GET, the data will be converted into query string:
encodeURIComponent(k)=encodeURIComponent(v)&encodeURIComponent(k)=encodeURIComponent(v)...
- If the method is POST and the headers ['content-type'] is application/json, the data will be JSON serialized.
- If the method is POST and the headers ['content-type'] is application/x-www-form-urlencoded, the data will be converted into query string:
encodeURIComponent(k)=encodeURIComponent(v)&encodeURIComponent(k)=encodeURIComponent(v)...

Success Callback Function

The type of the incoming parameter is Object with the following attributes:

||||| --- | --- | --- | --- | **Property** | **Type** | **Description** | data | String | Response data. The format depends on the value of dataType in the request. | status | Number | Response code. | headers | Object | Response header. |

Error Code

||||---|---|| **Error | Description** || 2 | Incorrect parameter. Check whether the URL is in HTTPS format and all parameters are correct. || 4 | Not authorized to call the interface. The error might result from the following:

- The server domain whitelist is not configured. In this case, configure the server domain whitelist under Mini Program > Configuration > Server Domain Whitelist. The mini program can only communicate with the domains in the whitelist when calling the `my.request` and `my.uploadFile` APIs. If the server domain whitelist is updated, the whitelist comes effective only when a new version of the mini program is published.
- Errors occur with your account and you cannot login to the mini program platform. In this case, when you debug in the Mini Program studio, select *Ignore httpRequest domain name validity check* or *Ignore Webview domain name validity check* under Details > Domain name information, and then preview the debugging request.
- Check whether the HTTP request domain name is incorrect. || 12 | Network error. || 13 | Timeout. || 14 | Decoding failure. || 19 | HTTP error. || 20 | Request stopped/service end traffic limit. |

Note:

The error code of 14 might be returned in the following cases:

- When the value of `dataType` is `json`, the Mini Program framework firstly perform the `JSON.parse` operation on the returned results. If the parsing fails, the error code of 14 is returned.
- When the value of `dataType` is `text` and the returned content has a bad format, the error code of 14 is returned.

To solve the error, check whether the `dataType` setting is incorrect firstly.

Return Value

RequestTask

Network request task object.

Method

`RequestTask.abort()`

Note:

If **Not authorized to call the interface** is returned, configure the domain whitelist under Mini Program > Configuration > Server Domain Whitelist in the mini program platform.

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_network_request

If yes, the domain name validity will not be checked in the simulator, preview, and real machine debugging scenarios. However, before the Mini Program goes online, you must maintain the domain names in the whitelist, otherwise, the domain names cannot be effective in the official release.

Important: `my.request` request header is `{'content-type': 'application/json'}` by default, instead of `{'content-type': 'application/x-www-form-urlencoded'}`.

Sample Code

copy

```
my.request({
  url: 'https://httpbin.org/post',
  method: 'POST',
  data: {
    from: 'Mini Program',
    production: 'JSAPI',
  },
  dataType: 'json',
  success: function(res) {
    my.alert({content: 'success'});
  },
  fail: function(res) {
    my.alert({content: 'fail'});
  },
  complete: function(res) {
```

```

        my.hideLoading();
        my.alert({content: 'complete'});
    }
});

const task = my.request({url: 'https://httpbin.org/post'})
task.abort()

```

Parameters

||||| --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | url | String | Yes | Target server url. || headers | Object | No | Set the request HTTP header. The default value is

```
{'content-type': 'application/json'}
. || method | String | No | The default value is GET. Both GET and POST are supported. || data | Object | No | Request parameter. || timeout | Number | No | Timeout period in ms. The default value is 30000. || dataType | String | No | Expected format of the returned data. The following formats are supported:
```

- json
- text
- base64

The default format is json. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

Data Parameter Description

Data transferred to the server is eventually expressed in String. If the type is not String, the data will be converted into String. Conversion rules are:

- If the method is GET, the data will be converted into query string:
encodeURIComponent(k)=encodeURIComponent(v)&encodeURIComponent(k)=encodeURIComponent(v)...
- If the method is POST and the headers ['content-type'] is application/json, the data will be JSON serialized.
- If the method is POST and the headers ['content-type'] is application/x-www-form-urlencoded, the data will be converted into query string:
encodeURIComponent(k)=encodeURIComponent(v)&encodeURIComponent(k)=encodeURIComponent(v)...

Success Callback Function

The type of the incoming parameter is Object with the following attributes:

||||| --- | --- | --- | --- | **Property** | **Type** | **Description** | data | String | Response data. The format depends on the value of dataType in the request. || status | Number | Response code. || headers | Object | Response header. |

Error Code

||||---|| Error | Description || 2 | Incorrect parameter. Check whether the URL is in HTTPS format and all parameters are correct. || 4 | Not authorized to call the interface. The error might result from the following:

- The server domain whitelist is not configured. In this case, configure the server domain whitelist under Mini Program > Configuration > Server Domain Whitelist. The mini program can only communicate with the domains in the whitelist when calling the `my.request` and `my.uploadFile` APIs. If the server domain whitelist is updated, the whitelist comes effective only when a new version of the mini program is published.
- Errors occur with your account and you cannot login to the mini program platform. In this case, when you debug in the Mini Program studio, select *Ignore httpRequest domain name validity check* or *Ignore Webview domain name validity check* under Details > Domain name information, and then preview the debugging request.
- Check whether the HTTP request domain name is incorrect. || 12 | Network error. || 13 | Timeout. || 14 | Decoding failure. || 19 | HTTP error. || 20 | Request stopped/service end traffic limit. |

Note:

The error code of 14 might be returned in the following cases:

- When the value of `dataType` is `json`, the Mini Program framework firstly perform the `JSON.parse` operation on the returned results. If the parsing fails, the error code of 14 is returned.

my.saveFile {#mysavefile}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.saveFile

2021-05-09 18:43

Save file in a local position (total capacity of local file size is limited to 10 MB).

Sample Code

copy

```
my.chooseImage({
  success: (res) => {
    my.saveFile({
      apFilePath: res.apFilePaths[0],
      success: (res) => {
        console.log(JSON.stringify(res))
      },
    });
  },
});
```

Parameters

Object type with the following attributes:

Property	Type	Required	Description
apFilePath	String	Yes	File path.
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

Property	Type	Description
apFilePath	String	File save path.

my.saveFile {#mysavefile}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.saveFile

2022-07-03 18:44

Save file in a local position (total capacity of local file size is limited to 10 MB).

Sample Code

copy

```
my.chooseImage({
  success: (res) => {
    my.saveFile({
      apFilePath: res.apFilePaths[0],
      success: (res) => {
        console.log(JSON.stringify(res))
      },
    });
  },
});
```

Parameters

Object type with the following attributes:

Property	Type	Required	Description
apFilePath	String	Yes	File path.
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

Property	Type	Description
apFilePath	String	File save path.

my.saveImage

2021-05-09 18:43

Save the online images to a device camera gallery.

Sample Code

copy

```
my.saveImage({url:'https://img.example.com/example.jpg'});
```

Parameters

||| | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || url | String | Yes | URL of the image to be saved. || showActionSheet | Boolean | No | Whether to show the menu when saving image, by default it is true. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Error Code

||| | --- | --- || **Error | Description** || 2 | Invalid parameter, no url parameter transferred.
|| 15 | Album right not enabled (iOS only). || 16 | Insufficient album storage on
cellphone (iOS only). || 17 | Other errors during picture saving. |

my.scan {#myscan}

Last updated: 2022-07-03

Path: *miniprogram_gcash*

my.scan

2022-07-03 18:44

Call the scan QR code or bar code function.

Hint: after calling `my.scan` API, the `onHide()` and `onShow()` lifecycle callback function of App and Page will be executed. The following is the executing sequence:

`App.onHide() -> Page.onHide() -> App.onShow() -> Page.onShow()`.

Sample Code

copy

```
Page({
  scan() {
    my.scan({
      type: 'qr',
      success: (res) => {
        my.alert({ title: res.code });
      },
    });
  }
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || type | String | No | Type for scanning (qr by default):

1. `qr`: two-dimensional QR scanning frame.
2. `bar`: Linear barcode scanning frame. || `hideAlbum` | Boolean | No | Hide album entry or not. If it is `false`, there will be an entry for user to select a picture from the album as the scanned picture. Otherwise, user will use camera to scan the content directly. By default, its value is `false`. || `success` | Function | No | Callback function upon call success. || `fail` | Function | No | Callback function upon call failure. || `complete` | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || `code` | String | Data returned from scanning. || `qrCode` | String | QR code data returned from scanning. || `barCode` | String | Bar code data returned from scanning. |

Error Code

|||| --- | --- || **Error** | **Description** || 10 | User cancellation. || 11 | Operation failure. |

my.scan {#myscan}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.scan

2021-05-09 18:43

Call the scan QR code or bar code function.

Hint: after calling `my.scan` API, the `onHide()` and `onShow()` lifecycle callback function of App and Page will be executed. The following is the executing sequence:

`App.onHide() -> Page.onHide() -> App.onShow() -> Page.onShow()`.

Sample Code

copy

```
Page({
  scan() {
    my.scan({
      type: 'qr',
      success: (res) => {
        my.alert({ title: res.code });
      },
    });
  }
})
```

Parameters

Property	Type	Required	Description
type	String No		Type for scanning (qr by default):

1. `qr`: two-dimensional QR scanning frame.

2. `bar`: Linear barcode scanning frame. || `hideAlbum` | Boolean | No | Hide album entry or not. If it is `false`, there will be an entry for user to select a picture from the album as the scanned picture. Otherwise, user will use camera to scan the content directly. By default, its value is `false`. || `success` | Function | No | Callback function upon call success. || `fail` | Function | No | Callback function upon call failure. || `complete` | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

--- --- ---	Property	Type	Description
code String	Data returned from scanning.	qrCode String	QR code data returned from scanning.
barCode String	Bar code data returned from scanning.		

Error Code

--- --- ---	Error	Description
10 User cancellation.	11 Operation failure.

my.sendSocketMessage {#mysendsocketmessage}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.sendSocketMessage

2021-05-09 18:43

Use this API to send data over WebSocket connection. Call [my.connectSocket](#) first and send data after the [my.onSocketOpen](#) callback.

Sample Code

copy

```
my.sendSocketMessage({
  data: this.data.toSendMessage, // The data to be sent
  success: (res) => {
    my.alert({content: 'The data sent!' +
this.data.toSendMessage});
  },
});
```

Note: The case is only for reference. Please use your own URL to test.

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || data | String | Yes |
The data to be sent, in text string or base64 encoded string. || isBuffer | Boolean | No | If
the value of this field is true, the data field represents the received base64 encoded
binary strings. If the value of this field is empty, the data field represents normal strings. |
| success | Function | No | The callback function for a successful API call. || fail | Function
| No | The callback function for a failed API call. || complete | Function | No | The
callback function used when the API call is completed. This function is always executed
no matter the call succeeds or fails. |

my.setBackgroundColor {#mysetbackgroundcolor}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.setBackgroundColor

2021-05-09 18:43

Dynamically set window background color.

Sample Code

copy

```
my.setBackgroundColor({
  backgroundColor: '#ff0000',
  backgroundColorTop: '#00ff00',
  backgroundColorBottom: '#ff00ff'
})
```

Parameters

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || backgroundColor |
HexColor | No | Window background color. For Android, this property is mandatory. ||
backgroundColorTop | HexColor | No | Top window background color, supported in iOS
only. || backgroundColorBottom | HexColor | No | Bottom window background color,

supported in iOS only. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

my.setNavigationBar {#mysetnavigationbar}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.setNavigationBar

2021-05-09 18:43

Set the navigation bar text and style.

Sample Code

copy

```

my.setNavigationBar({
  title: 'hello',
  backgroundColor: '#108ee9',
  success() {
    my.alert({
      content: 'Success',

```

```

    });
},
fail() {
  my.alert({
    content: 'Failed',
  });
},
);
}
);

```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | No | Navigation bar title. || image | String | No | Picture link address, must be https. Use 3x high-definition pictures. If the image is set, the title parameter is inactive. || backgroundColor | String | No | Navigation bar background color, supporting hex color value. || borderBottomColor | String | No | Navigation bar bottom border color, supporting hex color value If the backgroundColor is set, the borderBottomColor does not take effect. The backgroundColor is used by default. || reset | Boolean | No | Whether the navigation bar is reset to the default color, false by default. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

my.setNavigationBar

2022-07-03 18:44

Set the navigation bar text and style.

Sample Code

copy

```

my.setNavigationBar({
  title: 'hello',
  backgroundColor: '#108ee9',
  success() {

```

```
    my.alert({
        content: 'Success',
    });
},
fail() {
    my.alert({
        content: 'Failed',
    });
},
});
```

Parameters

Navigation bar title. || image | String | No | Picture link address, must be https. Use 3x high-definition pictures. If the image is set, the title parameter is inactive. Currently, SVG images are not supported. || backgroundColor | String | No | Navigation bar background color, supporting hex color value. || borderBottomColor | String | No | Navigation bar bottom border color, supporting hex color value If the backgroundColor is set, the borderBottomColor does not take effect. The backgroundColor is used by default. || reset | Boolean | No | Whether the navigation bar is reset to the default color, false by default. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

my.setScreenOrientation {#mysetscreenorientation}

Last updated: 2022-07-04

Path: miniprogram_gcash

my.setScreenOrientation

2022-07-04 03:44

Call this API to set screen orientation.

Note: For Android, calling this API to set screen orientation will be effective for all pages on the current mini program by default. When this API is called on a page to set the screen orientation, for example, to `portrait`, the screen orientation of all subpages entering from this page will also be `portrait`, the same as that of this page. Through certain processing, when returning from this page to previous pages, the orientation of these pages will not be affected.

Sample code

copy

```
my.setScreenOrientation({
  orientation: 'portrait',
  success: (res) => {
    my.alert({
      title: 'success',
      content: JSON.stringify(res)
    })
  },
  fail: (res) => {
    my.alert({
      title: 'fail',
      content: JSON.stringify(res)
    })
  }
})
```

Parameters

		---		---		---		---		Property		Type		Required		Description		orientation		String							
Yes		Indicates the orientation of the screen, <code>portrait</code> or <code>landscape</code> .		success		Function		No		Callback function upon call success		fail		Function		No		Callback function upon call failure		complete		Function		No		Callback function upon call completion (to be executed upon either call success or failure)	

Success callback function

		---		---		---		Property		Type		Description		success		Boolean		Specifies whether the call is successful. When the value is <code>true</code> , the call is successful.	
--	--	-----	--	-----	--	-----	--	----------	--	------	--	-------------	--	---------	--	---------	--	---	--

Fail callback function

||||| --- | --- | --- || **Property** | **Type** | **Description** || error | Number | The error code for the failure || errorMessage | String | The error message that describes the result code in detail |

my.setStorage {#mysetstorage}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.setStorage

2022-07-03 18:44

Store the data with a specified key in the local cache. This will overlap\ the original data using the same key.

This is an asynchronous interface.

Support the isolation of webview-embedded storage and the Mini Program storage. Specifying key storage data in embedded webview does not overlap the data corresponding to the same key of the Mini Program itself.

Sample Code

copy

```
my.setStorage({
  key: 'currentCity',
  data: {
    cityName: 'London',
    adCode: '330100',
    spell: ' London',
  },
  success: function() {
    my.alert({content: 'Set Success'});
  }
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || key | String | Yes | Cache data key. || data | Object/String | Yes | Data to be cached. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Note: When a single data is converted into a string, the string length is maximum 200*1024. For the same user, the cache of one Mini Program has an upper limit 10MB.

my.setTabBarStyle

2022-07-03 18:44

Use this API to set the overall style of the tab bar, such as the text color, background color and border style.

For more information, see [Tab bar FAQ](#).

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
my.setTabBarStyle({
  color: '#FF0000',
  selectedColor: '#00FF00',
  backgroundColor: '#0000FF',
  borderColor: 'white'
})
```

Parameters

Property	Type	Required	Description
color	HexColor	Yes	The default color of text on tab.
selectedColor	HexColor	Yes	The color of the selected text on tab.
backgroundColor	HexColor	Yes	The background color of tab.
borderStyle	String	Yes	The border color of tab bar, which only supports black / white.
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails.

my.showActionSheet {#myshowactionsheet}

Last updated: 2022-07-04

Path: miniprogram_gcash

my.showActionSheet

2022-07-04 03:44

Use this API to display the operation menu.

Sample Code

index.json

copy

```
// API-DEMO page/API/action-sheet/action-sheet.json
{
    "defaultTitle": "Operation Menu"
}
```

index.axml

copy

```
<!-- API-DEMO page/API/action-sheet/action-sheet.axml-->
<view class="page">
    <view class="page-description">Action sheet API</view>
    <view class="page-section">
        <view class="page-section-title">my.showActionSheet</view>
        <view class="page-section-demo">
            <button type="primary" onTap="showActionSheet">Show Action Sheet</button>
        </view>
    </view>
</view>
```

index.js

copy

```
// API-DEMO page/API/action-sheet/action-sheet.js
Page({
    showActionSheet() {
        my.showActionSheet({
            title: 'ActionSheet',
            items: ['Menu 1', 'Menu 2', 'Menu3'],

```

```

cancelButtonText: 'Cancel',
success: (res) => {
    const btn = res.index === -1 ? 'Cancel' : 'No' + res.index +
    '';
    my.alert({
        title: `You clicked ${btn} button`
    });
},
},
},
);

```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || title | String | No |
The title of the menu. || items | String Array | Yes | The text array of the menu button. ||
cancelButtonText | String | No | Text on the cancel button, which is "Cancel" by default.

Note:

This field is invalid for Android and the cancel button will not be displayed. ||
destructiveBtnIndex | Number | No | This field specifies the index number of a specific
button. The value starts from 0.

Used for buttons to delete or clear data or the ones in similar scenarios. The default color
is red. || badges | Object Array | No | For the array with red option. See badges
parameters below for the fields in the array. || success | Function | No | The callback
function for a successful API call. || fail | Function | No | The callback function for a
failed API call. || complete | Function | No | The callback function used when the API call
is completed. This function is always executed no matter the call succeeds or fails. |

Badges parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Description** || index | Number | The index of the
option that needs use red marks, starting from 0. || type | String | Red mark types. Valid
values are:

- none: no red mark
- point: red mark
- num: numerical red mark
- text: texts in red || text | String | Customized red mark:
- This field is optional when the value of type is none/ point/more;
- When the value of type is num, but the value of this field has decimals, not greater than
0, or not less than 100, this field is not displayed. |

my.showAuthGuide {#myshowauthguide}

Last updated: 2021-05-09

Path: miniprogram_gcash

my.showAuthGuide

2021-05-09 18:43

Pop up dialog for user in form of (image, text, etc.) via the permission guide module. To advice the user to turn on the related permission. The permission guide is used to advice rather than to validate the permission. The call timing is when the service party confirms the required permission is limited. In addition, the permission guide pop-up is subject to fatigue and other factors.

Sample Code

copy

```
// API-DEMO page/API/show-auth-guide/show-auth-guide.json
{
    "defaultTitle": "Permission guide"
}
```

copy

```
<!-- API-DEMO page/API/show-auth-guide/show-auth-guide.axml-->
<view class="page">
    <view class="page-description">Permission guide API</view>
    <view class="page-section">
        <view class="page-section-title">my.showAuthGuide</view>
        <view class="page-section-demo">
            <button type="primary" onTap="showAuthGuide">Permission
            guide</button>
        </view>
    </view>
</view>
```

copy

```
// API-DEMO page/API/show-auth-guide/show-auth-guide.js
Page({
    showAuthGuide() {
        my.showAuthGuide({
            authType: 'LBS',
            success: (res)=>{
                //When shown is true, it indicates the permission guide
                //pop-up will be shown; when it is false, it indicates the user has
                //allowed the permission.
                my.alert({content: 'Call success: '+JSON.stringify(res),
            });
            },
            fail:(error)=>{
                my.alert({content: 'Call failure: '+JSON.stringify(error),
            });
            },
        });
    }
});
```

```
  },
});
```

Parameters

String type with the following attributes:

	Property	Type	Required	Description
authType	String	Yes	Identifier of the permission under guide, used to identify the type of the permission (such as LBS).	
success	Function	No	Callback function upon call success.	
fail	Function	No	Callback function upon call failure.	
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).	

Supported authType

Permission name	Permission code
Microphone permission	MICROPHONE
Addressbook permission	ADDRESSBOOK
Camera permission	CAMERA
Photo permission	PHOTO
Lbs switch	LBS

// API-DEMO page/API/show-auth-guide/show-auth-guide.js
Page({
    showAuthGuide() {
        my.showAuthGuide({
            authType: 'LBS',
            success:(res)=>{
                //When shown is true, it indicates the permission guide
                pop-up will be shown; when it is false, it indicates the user has
                allowed the permission.
                my.alert({content: 'Call success: '+JSON.stringify(res),
            });
            },
            fail:(error)=>{
                my.alert({content: 'Call failure:'+JSON.stringify(error),
            });
            },
        });
    },
});

```

Parameters

String type with the following attributes:

Property	Type	Required	Description
authType	String	Yes	Identifier of the permission under guide, used to identify the type of the permission (such as LBS).
success	Function	No	Callback function upon call success.
fail	Function	No	Callback function upon call failure.
complete	Function	No	Callback function upon call completion (to be executed upon either call success or failure).

Supported authType

||||| --- | --- || **Permission name** | **Permission code** || Microphone permission |
 MICROPHONE || Addressbook permission | ADDRESSBOOK || Camera permission |
 CAMERA || Photo permission | PHOTO || Lbs switch | LBS |

my.showLoading

2022-07-03 18:44

Show the loading dialog.

Sample Code

copy

```
my.showLoading({
  content: 'loading...',
  delay: 1000,
});
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || content | String |
 No | Text contents of loading. || delay | Number | No | Displaying delay, in ms, 0 by
 default If my.hideLoading was called before this time, it is not displayed. || success |
 Function | No | Callback function upon call success. || fail | Function | No | Callback
 function upon call failure. || complete | Function | No | Callback function upon call
 completion (to be executed upon either call success or failure). |

my.signContract {#mysigncontract}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.signContract

2022-07-03 18:44

Use this API to redirect the user to the authorization page. After the user completes the authorization, the app will return the authorization code which can be used to obtain the access token for the agreement payment.

Note:

Please make sure you use the Appx with 1.24.6 or higher versions in order to use this API.

Below is a diagram that illustrates how the interaction works:

The merchant Mini Program server can call [authorization consult API](#) in step 2 to get the sign content with an authorization URL. Then the Mini Program will call the `my.signContract` JSAPI to invoke the authorization process. After the user completes the authorization, the Mini Program sends JSAPI result to its server so that the server can call [apply token API](#) to get accessToken.

Sample code

copy

```
my.signContract({
  signStr: 'https://openauth.xxx.com/authentication.htm?',
  authId=FBF16F91-28FB-47EC-B9BE-27B285C23CD3',
  success: (res) => {
    my.alert({
      content: JSON.stringify(res),
    });
  },
  fail: (res) => {
    my.alert({
      content: JSON.stringify(res),
    });
  }
});
```

Parameters

Property	Type	Required	Description
signStr	String	Yes	This parameter is the authorization string returned by the app to further the authorization process.

fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

||||| --- | --- | --- | | **Property | Type | Description** || authState | String | The authorization status. It is generated in Mini Program server and sent to app server. The maximum length is 256. Refer [here](#) for details. || authCode | String | The authorization code assigned by app which can be used to obtain the access token for the agreement payment. The maximum length is 32. |

An example of a successfully returned message is as follows:

```
copy

{
  "authState": "663A8FA9-D836-48EE-8AA1-1FF682989DC7",
  "authCode": "663A8FA9D83648EE8AA11FF682989DC7"
}
```

Fail Callback Function

||||| --- | --- | --- | | **Property | Type | Description** || error | String | The error code for the failure. || errorMessage | String | The error message. |

Error Code

When error happens, the fail callback function will be executed. The error code can refer to the following table.

||||| --- | --- | | **Error Code | Description** || 6001 | User cancels the sign process. || 6002 | The sign fails because of network error. || 7001 | The result of the sign is unknown, it may be successful. || 7002 | The sign fails. |

Last updated: 2022-07-03

Path: miniprogram_gcash

my.startBluetoothDevicesDiscovery

2022-07-03 18:44

Use this API to start discovering bluetooth devices. You can find the results in the API [my.onBluetoothDeviceFound](#).

Note:

To avoid consuming too many system resources, stop the search by calling the API **my.stopBluetoothDevicesDiscovery** after you find and connect to the device.

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

Property	Type	Required	Description
services	Array	No	UUID list of the service in the bluetooth device.
allowDuplicatesKey	Boolean	No	Determines whether to allow for duplicate keys. If yes, the API my.onBluetoothDeviceFound will report for this device, with different RSSI values.
interval	Integer	No	By default, the interval is 0, which means once a new device is found, the device will be reported; otherwise, the reporting frequency is the interval value.
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function for a completed API call (regardless of whether the call is successful or not).

my.startBluetoothDevicesDiscovery

2021-05-09 18:43

Use this API to start discovering bluetooth devices. You can find the results in the API [my.onBluetoothDeviceFound](#).

Note:

To avoid consuming too many system resources, stop the search by calling the API [my.stopBluetoothDevicesDiscovery](#) after you find and connect to the device.

Currently simulation in IDE is not supported. Please debug in the production environment.

```

Parameters

The input parameters are displayed in the following table:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || services | Array | No | UUID list of the service in the bluetooth device. || allowDuplicatesKey | Boolean | No | Determines whether to allow for duplicate keys. If yes, the API my.onBluetoothDeviceFound will report for this device, with different RSSI values. || interval | Integer | No | By default, the interval is 0, which means once a new device is found, the device will be reported; otherwise, the reporting frequency is the interval value. || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function for a completed API call (regardless of whether the call is successful or not). |

my.startPullDownRefresh

2021-05-09 18:43

Start the pull-to-refresh function. The pull-to-refresh animation is triggered upon the code execution, which is consistent with the manual pull-to-refresh effect.

Sample Code

copy

```
my.startPullDownRefresh()
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.stopBluetoothDevicesDiscovery

2021-05-09 18:43

Use this API to stop discovering bluetooth devices.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

Parameters

The input parameters are displayed in the following table:

Property	Type	Required	Description
success	Function	No	The callback function for a successful API call.
fail	Function	No	The callback function for a failed API call.
complete	Function	No	The callback function for a completed API call (Regardless of whether the call is successful or not).

my.stopBluetoothDevicesDiscovery

2022-07-03 18:44

Use this API to stop discovering bluetooth devices.

Note:

Currently simulation in IDE is not supported. Please debug in the production environment.

my.stopPullDownRefresh

2022-07-03 18:44

Stop the pull-to-refresh for the current page.

Sample Code:

copy

```
Page({
  onPullDownRefresh(){
    my.stopPullDownRefresh()
  }
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || success | Function | No | The callback function for a successful API call. || fail | Function | No | The callback function for a failed API call. || complete | Function | No | The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails. |

my.switchTab {#myswitchtab}

Last updated: 2022-07-03

Path: miniprogram_gcash

my.switchTab

2022-07-03 18:44

Introduction

Jump to the specified tabBar page, and then close all other pages that are not tabBar.

If the Mini Program has multiple tabs, you can use `tabBar` to configure the behavior of the specified tab, and the page to display during the tab switchover (You can switch tabs at the bottom of the client window).

Note: You can jump to the page via page jumping (`my.navigateTo`) or page redirecting (`my.redirectTo`). Even the page is defined in the tabBar configuration, the bottom tab bar is not displayed. In addition, the first page of the tabBar must be the homepage.

Sample Code

copy

```
// app.json
{
  "tabBar": {
    "items": [{\
      "pagePath": "page/home/index", \
      "name": "Home"\
    }, {\
      "pagePath": "page/user/index", \
      "name": "User"\
    }]
  }
}
```

copy

```
my.switchTab({
  url: 'page/home/index'
})
```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || url | String | Yes | Path of the jumping tabBar page (page to be defined in the tabBar field in the app.json).

Note:

The path cannot be followed by parameters. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

tabBar Configuration

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || textColor | HexColor | No | Text color. || selectedColor | HexColor | No | Color of highlighted text. || backgroundColor | HexColor | No | Background color. || items | Array | Yes | Configured for each tab. |

Configured for each item:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || pagePath | String | Yes | Set page path. || name | String | Yes | Name. || icon | String | No | Normal icon path. || activeIcon | String | No | Highlighted icon path. |

The recommended icon size is 60*60px. The system performs unequal stretching and scaling for any incoming picture.

Example

copy

```
{
  "tabBar": {
    "textColor": "#dddddd",
    "selectedColor": "#49a9ee",
    "backgroundColor": "#ffffff",
    "items": [
      {
        "pagePath": "pages/index/index",
        "name": "Home"
      },
      {
        "pagePath": "pages/logs/logs",
        "name": "Log"
      }
    ]
  }
}
```

my.tradePay {#mytradepay}

Last updated: 2022-07-04

Path: miniprogram_gcash

my.tradePay

2022-07-04 03:44

Start a payment transaction.

Sample Code

copy

```
my.tradePay({
  tradeNo: '201711152100110410533667792', // get the tradeNo from the
server first
  success: (res) => {
    my.alert({
      content: JSON.stringify(res),
    });
  }
});
```

```

},
fail: (res) => {
  my.alert({
    content: JSON.stringify(res),
  });
}
);

```

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || tradeNO | String | No | The trade number. Its maximum length is 64. Refer [here](#)

for details. || orderStr | String | No | A string of complete payment parameters, which is recommended to be obtained from the server. Refer [here](#)

for details. || paymentUrl | String | No | The url of payment page. Refer [here](#)

for details. || success | Function | No | Callback function upon call success. || fail | Function | No | Callback function upon call failure. || complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

The tradeNo, orderStr and paymentUrl are different ways to start the payment transaction. **The Mini Program should use either one of them to start a payment transaction according to the payment service provided by the host app.**

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || resultCode | String | Yes | The result code of the pay process. |

An example of a successfully returned message is as follows:

```

copy

{
  "resultCode": "9000"
}

```

Result Code

|||| --- | --- || **resultCode** | **Description** || 9000 | Payment is successful. || 8000 | Trade is processing. || 4000 | Payment is failed. || 6001 | User cancels to pay. || 6002 | Network exception. || 6004 | Unknown pay result, may be success. |

my.uploadFile

2021-05-09 18:43

Upload the local resource to the server.

Sample Code

copy

```
my.uploadFile({
    url: 'Please use your own server address',
```

```

fileType: 'image',
fileName: 'file',
filePath: '...',
success: (res) => {
  my.alert({
    content: 'Upload success'
  });
},
);

```

Parameters

||||| --- | --- | --- | --- | | **Property** | **Type** | **Required** | **Description** | | url | String | Yes | Address of the developer server. | | filePath | String | Yes | Local locator of the file resource to be uploaded. | | fileName | String | Yes | Filename, also the corresponding key. The developer uses this key at the server side to get the file binary contents. | | fileType | String | Yes | File type. The following file types are supported:
- PDF
- DOC
- DOCX
- XLS
- XLSX
- PPT
- PPTX | | header | Object | No | HTTP request Header. | | formData | Object | No | Other additional form data in the HTTP request. | | success | Function | No | Callback function upon call success. | | fail | Function | No | Callback function upon call failure. | | complete | Function | No | Callback function upon call completion (to be executed upon either call success or failure). |

Success Callback Function

The incoming parameter is of the Object type with the following attributes:

||||| --- | --- | --- | | **Property** | **Type** | **Description** | | data | String | Data returned from the server. | | statusCode | String | HTTP status code. | | header | Object | Header returned from the server. |

Error Code

|||| --- | --- | | **Error** | **Description** | | 11 | File nonexistent. | | 12 | File uploading failed. | | 13 | No right. |

my.watchShake

2021-05-10 03:43

The watchshake function. Every time this API is called, a callback is triggered after the mobile phone is shaken. You must call this API again to continue to listen to this event.

Sample Code

copy

```
// API-DEMO page/API/watch-shake/watch-shake.json
{
  "defaultTitle": "Shake"
}
```

copy

```
<!-- API-DEMO page/API/watch-shake/watch-shake.axml-->
<view class="page">
```

```

<button type="primary" onTap="watchShake">
    Bind the shake function and click the shake button to see the
    effect.
</button>
</view>

```

copy

```

// API-DEMO page/API/watch-shake/watch-shake.js
Page({
    watchShake() {
        my.watchShake({
            success: function() {
                console.log('It moved')
                my.alert({ title:'It moved o.o'});
            }
        });
    },
});

my.writeBLECharacteristicValue

2022-07-03 18:44

Use this API to write data to Bluetooth Low Energy (BLE) device characteristics.

Instructions:

- The device characteristics must support writing to use this API. See properties in [my.getBLEDeviceCharacteristics](#) for details.
- The written binary data needs Hex coding.

Note:

Currently simulation in IDE is not supported. Please debug in production environment.

Sample Code

copy

```
my.writeBLECharacteristicValue({
  deviceId: deviceId,
  serviceId: serviceId,
  characteristicId: characteristicId,
  value: 'fffe',
  success: (res) => {
    console.log(res)
  },
  fail:(res) => {
  },
  complete: (res)=>{
  }
});
```

Parameters

	Property	Type	Required	Description
deviceId	String	Yes	The Bluetooth device ID.	
serviceId	String	Yes	The UUID of the service corresponding to a Bluetooth characteristic.	
characteristicId	String	Yes	The Bluetooth characteristic UUID.	
value	Hex String	Yes	The value corresponding to the Bluetooth device characteristic, which is a hexadecimal string, limited to 20 bytes.	
success	Function	No	The callback function for a successful API call.	
fail	Function	No	The callback function for a failed API call.	
complete	Function	No	The callback function used when the API call is completed. This function is always executed no matter the call succeeds or fails.

onPullDownRefresh

2022-07-03 18:44

On the Page, customize the onPullDownRefresh function to listen to the pull-to-refresh event from the user.

- The "pullRefresh": true options needs to be configured in the .json configuration file of the related page to enable the pull-to-refresh event.
- when the data refresh is processed completely, call my.stopPullDownRefresh to stop the pull-to-refresh for that page.

Sample Code:

In the pull-down-refresh.json configuration file, the code configuration is as below:

copy

```
{
  "pullRefresh": true
}
```

In the Page, define the onPullDownRefresh processing function:

copy

```
onPullDownRefresh() {
  console.log('onPullDownRefresh', new Date())
}
```

scroll-view

2021-05-09 18:43

Scroll view region

Scan QR code to try:

Property	Type	Default	Description
class	String		External style name.
style	String		Inline style name.
scroll-x	Boolean	false	Allow horizontal scroll.
scroll-y	Boolean	false	Allow vertical scroll.
upper-threshold	Number	50	How far it is to top/left (in px) to trigger the scrolltoupper event.
lower-threshold	Number	50	How far it is to bottom/right (in px) to trigger the scrolltolower event.
scroll-top	Number		Set location of virtual scroll bar.
scroll-left	Number		Set location of horizontal scroll bar.
scroll-into-view	String		Value is an element ID, scrolling to that element, element top aligning with scroll region top.
onScrollToUpper	EventHandle		Scroll to top/left triggers the scrolltoupper event.
onScrollToLower	EventHandle		Scroll to bottom/right triggers the scrolltolower event.
onScroll	EventHandle		Trigger on scroll, event.detail = {scrollLeft, scrollTop, scrollHeight, scrollWidth}.

When vertical scroll is used, a fixed height is required, which is set by using `acss`.

Sample Code

copy

```
<view class="page">
    <view class="page-description">Scroll view region</view>
    <view class="page-section">
        <view class="page-section-title">vertical scroll</view>

slider

2022-07-03 18:44

Slide selector

Property	Type	Description
name	String	Component name, used for form submission to obtain data.
min	Number	0
max	Number	100
Maximum	Number	1
step	Number	Step, must be greater than 0 and can be exactly divided by (max - min).
disabled	Boolean	false
Disable or not.		
value	Number	0
Current value.		
show-value	Boolean	false
Show current value or not.		
active-color	String	#108ee9
Selected color.		
background-color	String	#ddd
Background bar color.		
track-size	Number	4
Track line height.		
handle-size	Number	22
Slider size.		
handle-color	String	#fff
Slider fill color.		
onChange	EventHandle	Trigger on completion of a drag, event.detail = {value: value}.
onChanging	EventHandle	Event triggered in process of drag, event.detail = {value: value}.

view

2022-07-03 18:44

View container Equivalent with the div of web or the view of react-native.

Property	Type	Description
Boolean	false	Forbid scroll page within region.
String		Style class to be added upon clicking.
Number		Start the clicking status after a period of holding, in millisecond.
Number		Hold the clicking status after release, in millisecond.
boolean	false	Hide or not.
String		Custom style name.
String		Inline style.
EventHandle		onClick
EventHandle		onTouchStart
EventHandle		onTouchMove
EventHandle		onTouchEnd
EventHandle		onTouchCancel
EventHandle		onLongTap
		Trigger on 500ms-duration pressing. After long-press event, moving does not trigger screen scroll.

Note: The animation generated with my.createAnimation is realized via transition and triggers only onTransitionEnd, but does not trigger onAnimationStart, onAnimationIteration or onAnimationEnd.

Sample Code

copy

```
<view class="post">
  <!-- hidden -->
  <view class="postUser" hidden>
    <view class="postUser__name">Jessie</view>
  </view>
  <!-- hover class -->

web-view

2022-07-03 18:44

Webview

| This component does not support personal Mini Program temporarily.

<web-view/> The component is a component that is used to carry H5 webpage and automatically bespreads the whole Mini Program page.

||||| --- | --- | --- | --- || **Property** | **Type** | **Default** | **Description** || src | String | No | H5 webpage URL to be rendered in web-view H5 webpage URL needs login Mini Program management background- In Mini Program details - Setting, configure H5 domain whitelist. || onMessage | EventHandle | No | postMessage message from webpage to Mini Program e.detail = { data }. |

| Each page can have only one . Do not render multiple . It bespreads whole page and overlaps other components.

Sample Code

copy

```
<!-- axml -->
<!-- web-view pointing to google -->
<web-view src="https://google.com/" onMessage="test"></web-view>
```

APIs Available

||||| --- | --- | --- || **API Type** | **Name** | **Description** || Navigation | my.navigateTo | Navigate to another page of the app while keeping current one. || Navigation | my.navigateBack | Close current page and return to one of the pages before. || Navigation

|| my.switchTab | Navigate to a page on tabBar and close any other pages that are not on the tabBar. || Navigation | my.reLaunch | Close all pages and navigate to a page from the app. || Navigation | my.redirectTo | Close current page and navigate to a page from the app. || Image | my.chooseImage | Take a photo or choose one from the album. (The file path of the obtained photo can be sent to the current mini program via my.postMessage(), and then be uploaded if needed.) || Image | my.previewImage | Preview the image. || Location | my.getLocation | Get location information of current user. || Popups | my.alert | Show alert window. || Popups | my.showLoading | Show loading indicator. || Popups | my.hideLoading | Hide loading indicator. || Storage | my.setStorage | Store some data in local storage with a key. Will overwrite if the key already exists. || Storage | my.getStorage | Retrieve stored data. || Storage | my.removeStorage | Delete stored data. || Storage | my.clearStorage | Clear local storage. || Storage | my.getStorageInfo | Get information about local storage asynchronously. || Network | my.getNetworkType | Get information about current network status. || Payment | my.tradePay | Invoke payment procedures. (Don't process payment in H5 environment, and always call this API for payments.) || Message | my.postMessage | Send message to the current mini program, in JSON format. || Message | my.onMessage | Listen to messages from the current mini program. || Environment | my.getEnv | Get information about current environment. |

Demo Code

Code for web-view page for H5.

copy

```
<script type="text/javascript" src="https://appx/web-view.min.js">
</script>
<script>
    my.navigateTo({url: '../get-user-info/get-user-info'});

    // Send message to Mini Program.
    my.postMessage({name:"test web-view"});

    // Did receive message from Mini Program.
    my.onMessage = function(e) {
        console.log(e); // {'sendToWebView': '1'}
    }
    // Check if is run in Mini Program environment
    my.getEnv(function(res) {
        console.log(res.miniprogram) // true
    });
</script>
```

After my.postMessage is called, onMessage will be executed in this mini program page.

copy

```
<!-- .axml -->
<view>
    <web-view id="web-view-1" src="..." onMessage="test"></web-view>
</view>
```

copy

```
// A 'test' method is declared in this page.
// As web-view in page.axml has set 'test' for the call of
'onMessage',
// after my.postMessage is executed in the web-view, test will be
called.
Page({
  onLoad(e){
    this.webViewContext = my.createWebViewContext('web-view-1');
  },
  test(e){
    my.alert({
      content:JSON.stringify(e.detail),
    });
    this.webViewContext.postMessage({'sendToWebView': '1'});
  },
});
```

Navigation	my.switchTab	Navigate to a page on tabBar and close any other pages that are not on the tabBar.
Navigation	my.reLaunch	Close all pages and navigate to a page from the app.
Navigation	my.redirectTo	Close current page and navigate to a page from the app.
Image	my.chooseImage	Take a photo or choose one from the album. (The file path of the obtained photo can be sent to the current mini program via my.postMessage(), and then be uploaded if needed.)
Image	my.previewImage	Preview the image.
Location	my.getLocation	Get location information of current user.
Popups	my.alert	Show alert window.
Popups	my.showLoading	Show loading indicator.
Popups	my.hideLoading	Hide loading indicator.
Storage	my.setStorage	Store some data in local storage with a key. Will overwrite if the key already exists.
Storage	my.getStorage	Retrieve stored data.
Storage	my.removeStorage	Delete stored data.
Storage	my.clearStorage	Clear local storage.
Storage	my.getStorageInfo	Get information about local storage asynchronously.
Network	my.getNetworkType	Get information about current network status.
Payment	my.tradePay	Invoke payment procedures. (Don't process payment in H5 environment, and always call this API for payments.)
Message	my.postMessage	Send message to the current mini program, in JSON format.
Message	my.onMessage	Listen to messages from the current mini program.
Environment	my.getEnv	Get information about current environment.

Demo Code

Code for web-view page for H5.

copy

```
<script type="text/javascript" src="https://appx/web-view.min.js">
</script>
<script>
  my.navigateTo({url: '../get-user-info/get-user-info'});
  // Send message to Mini Program.
  my.postMessage({name:"test web-view"});
  // Did receive message from Mini Program.
  my.onMessage = function(e) {
```

```

        console.log(e); // {'sendToWebView': '1'}
    }
    // Check if is run in Mini Program environment
    my.getEnv(function(res) {
        console.log(res.miniprogram) // true
    });
</script>

```

After `my.postMessage` is called, `onMessage` will be executed in this mini program page.

copy

```

<!-- .axml -->
<view>
    <web-view id="web-view-1" src="..." onMessage="test"></web-view>
</view>

```

copy

```

// A 'test' method is declared in this page.
// As web-view in page.axml has set 'test' for the call of
// 'onMessage',
// after my.postMessage is executed in the web-view, test will be
// called.
Page({
    onLoad(e){
        this.webViewContext = my.createWebViewContext('web-view-1');
    },
    test(e){
        my.alert({
            content:JSON.stringify(e.detail),
        });
        this.webViewContext.postMessage({'sendToWebView': '1'});
    },
});

```
