What GCash Service were you unsatisfied with?-

Tell us more about your verification problems with GCash.

A. Please confirm your identity by submitting a copy of any of the documents listed below.

- Digitally Printed Government-issued ID (NBI Clearance, SSS ID, UMID, Driver's License, etc)
- Passport If your name is different from the document or ID presented, you must supply a copy of documentary evidence to confirm the provided ID (e.g., marriage certificate, change of name deed or statutory declaration).

B. If your request is made by an authorized representative, please confirm the identity of your Authorized Representative by submitting a copy of any of the documents listed below and authorization letter

- Digitally Printed Government-issued ID (NBI Clearance, SSS ID, UMID, Driver's License, etc)
- Passport
- Not Applicable

The data collected here will only be used to validate your identity and process your request for data/account deletion. Once you have completed the form and we've validated your identity, we will process the deletion of your account.

I agree & consent to delete my GCash account linked to my Old No. if I have no unpaid balances in GCredit/GLoan/GGives. I understand that I will LOSE Transaction History, GScore, GForest, Piggy Bank & other Information from my old account.

Yes, I agree

I have attached a clear copy of a Valid ID on the attachment section below

Notarized Affidavit (for funds 1k and above)

I have attached a Notarized Affidavit (required for Non-Fully Verified Old Accounts)

Screenshot of email about your account deactivation

I have attached a screenshot of the email I received from hello@gcash.com

I have attached the accomplished form on the attachment section below

Note: You may download the form via the link from Instruction #2 above.

I have attached a Authorization Letter, Passport or Valid ID of authorized representative on the attachment section below

Please choose a reason below-

When did you buy your sim?

Prepaid or Postpaid-

Is this your personal or company issued phone number?-

Company Name

Complete Address of Branch

Please include region and major island group (Luzon, Visayas, or Mindanao) ex. 999 General Luna St, ABC Village, Brgy 999, Bacoor City, Cavite, Luzon.

Point Person to Receive the Kit

What is the merchant name displayed in the QR?

Store Name

GCash Pera Outlet ID

Date of last verification attempt-

Please provide a screenshot of your verification landing page. To access this, go to your GCash App > Profile > Verify Now

Did you share your MPIN (4 digit number) to anyone?-

Did you share your OTP? (6 digit number)-

Did you share your personal/account information with anyone? Has your MPIN been reset without your knowledge?-

What was the unauthorized transaction made on your account and the total amount being disputed?

Did you share your OTPs from your linked bank account in Gcash?-

Was your GCash account linked to other online applications like Lazada, Shopee, FoodPanda, etc without your consent?-

If yes, what online applications were linked?

How did you pay?-

Card and payment method used-

What card did you use and how did you pay?

Select which statement is most relevant to you-

Location of Purchase-

Was the transaction made locally or internationally?

Anong klaseng scam ang na-experience mo?-

Did you continue with the transaction and paid again?-

Date encountered

If you saw an error code, pleasse input it in this box. If none, put 0

Error codes are usually a combination of 2 letters followed by numbers. Examples are AR861200 or MR502200

What type of error did you experience?-

Others

I certify that I consent to GCash and its partner's processing and updating my mobile number in order for me to access my Account.

I confirm that I did the action to increase my wallet limit but it has been more than 3 days and it still hasn't been upgraded

Valid Government Issued ID (eg. SSS ID, UMID, Driver's License, Passport, etc.)*

I have attached a clear copy of a Valid ID on the attachment section below (required)

Selfie holding your valid ID which clearly shows the details.

I have attached a clear selfie holding my Valid ID on the attachment section below (required)

What Happened in Your Most Recent Verification Attempt-

In which step did you encounter an error?-

Please provide a screenshot of the error you encountered

Nag reach out ka na ba sa merchant about sa iyong concern?-

Please ensure that you've contacted the merchant. If the transaction is successful in our system, you will be requested to reach out to the merchant directly to settle your concern

Natry mo na bang iunlink ang Gcash account mo mula sa merchant?-

You may check our Help Center article for the step-by-step guide on how to unlink your Gcash account from merchants

Anong naging issue when you unlinked your GCash account?-

Screenshot of phone settings showing the mobile number

Screenshot of transaction or error prompt

Take a screenshot of the transaction or error prompt and attach them to this request

I have attached the screenshot of my Phone/SIM Settings showing my GCash number.

I have attached the screenshot of the SMS/e-mail about the linked device

Why do you want to close your account?-

In the textbox below, please include 1) the email address you registered with the merchant, 2) your username or account ID, and 3) the ticket or request number you have with the merchant.

I have uploaded my Valid ID & Selfie holding the valid ID below

Upload a Valid ID accepted in our KYC (<https://help.gcash.com/hc/en-us/articles/900000948786-Accepted-IDs-for-GCash-Verification>)

Have you coordinated with merchant? Did they process the refund on their end and provided an SLA?

I-share kung saan kayo nag-usap ng alleged scammer (ex. Messenger, Viber at name n'ya sa social media or contact number. (e.g. Messenger, Messenger name: GCash Lending)

(at least 15 characters)

I-share kung paano mo nasabi na na-scam ka.

(at least 50 characters)

I-share kung kailan mo una at huling nakausap ang alleged scammer.

Please follow this format: MM/DD/YYYY

Are you trying to recover access to your lost SIM?-

Do you have the following documents? (Valid ID's & Selfie with valid ID's)-

Did you receive an SMS that your account was put on hold due to routine verification?-

Do you have the following documents? (2 Valid ID's & Selfie with 2 valid ID's)-

I hereby declare that the information provided herein are true and correct of my own knowledge. I also understand that any willful dishonesty or untruthful information on my part is a ground for disapproval and/or immediate termination of my account.

Select which statement is most relevant to you-

Incorrect Account Number / Bank

Correct Account Number / Bank

Please share what happened or add other information about your concern

You may attach screenshots or files related to your concern.

I agree to share my personal information with the other party in hopes of resolving our dispute.

I agree & consent to delete my GCash account linked to my Old No. if I have no unpaid balances in GCredit/GLoan/GGives. I understand that I will LOSE Transaction History, GScore, GForest, Piggy Bank & other Information from my old account.

Yes, I agree

I have attached a clear copy of a Valid ID on the attachment section below

Notarized Affidavit (for funds 1k and above)

I have attached a Notarized Affidavit (required for Non-Fully Verified Old Accounts)

Screenshot of email about your account deactivation

I have attached a screenshot of the email I received from hello@gcash.com

I have attached the accomplished form on the attachment section below

Note: You may download the form via the link from Instruction #2 above.

I have attached a Authorization Letter, Passport or Valid ID of authorized representative on the attachment section below

Please choose a reason below-

When did you buy your sim?

Prepaid or Postpaid-

Is this your personal or company issued phone number?-

Company Name

Complete Address of Branch

Please include region and major island group (Luzon, Visayas, or Mindanao) ex. 999 General Luna St, ABC Village, Brgy 999, Bacoor City, Cavite, Luzon.

Point Person to Receive the Kit

What is the merchant name displayed in the QR?

Store Name

GCash Pera Outlet ID

Date of last verification attempt-

Please provide a screenshot of your verification landing page. To access this, go to your GCash App > Profile > Verify Now

Did you share your MPIN (4 digit number) to anyone?-

Did you share your OTP? (6 digit number)-

Did you share your personal/account information with anyone? Has your MPIN been reset without your knowledge?-

What was the unauthorized transaction made on your account and the total amount being disputed?

Did you share your OTPs from your linked bank account in Gcash?-

Was your GCash account linked to other online applications like Lazada, Shopee, FoodPanda, etc without your consent?-

If yes, what online applications were linked?

How did you pay?-

Card and payment method used-

What card did you use and how did you pay?

Select which statement is most relevant to you-

Location of Purchase-

Was the transaction made locally or internationally?

Anong klaseng scam ang na-experience mo?-

Did you continue with the transaction and paid again?-

Date encountered

If you saw an error code, please input it in this box. If none, put 0

Error codes are usually a combination of 2 letters followed by numbers. Examples are AR861200 or MR502200

What type of error did you experience?-

Others

I certify that I consent to GCash and its partner's processing and updating my mobile number in order for me to access my Account.

I confirm that I did the action to increase my wallet limit but it has been more than 3 days and it still hasn't been upgraded

Valid Government Issued ID (eg. SSS ID, UMID, Driver's License, Passport, etc.)*

I have attached a clear copy of a Valid ID on the attachment section below (required)

Selfie holding your valid ID which clearly shows the details.

I have attached a clear selfie holding my Valid ID on the attachment section below (required)

What Happened in Your Most Recent Verification Attempt-

In which step did you encounter an error?-

Please provide a screenshot of the error you encountered

Nag reach out ka na ba sa merchant about sa iyong concern?-

Please ensure that you've contacted the merchant. If the transaction is successful in our system, you will be requested to reach out to the merchant directly to settle your concern

Natry mo na bang iunlink ang Gcash account mo mula sa merchant?-

You may check our Help Center article for the step-by-step guide on how to unlink your Gcash account from merchants

Anong naging issue when you unlinked your GCash account?-

Screenshot of phone settings showing the mobile number

Screenshot of transaction or error prompt

Take a screenshot of the transaction or error prompt and attach them to this request

I have attached the screenshot of my Phone/SIM Settings showing my GCash number.

I have attached the screenshot of the SMS/e-mail about the linked device

Why do you want to close your account?-

In the textbox below, please include 1) the email address you registered with the merchant, 2) your username or account ID, and 3) the ticket or request number you have with the merchant.

I have uploaded my Valid ID & Selfie holding the valid ID below

Upload a Valid ID accepted in our KYC (<https://help.gcash.com/hc/en-us/articles/900000948786-Accepted-IDs-for-GCash-Verification>)

Have you coordinated with merchant? Did they process the refund on their end and provided an SLA?

I-share kung saan kayo nag-usap ng alleged scammer (ex. Messenger, Viber at name n'ya sa social media or contact number. (e.g. Messenger, Messenger name: GCash Lending)

(at least 15 characters)

I-share kung paano mo nasabi na na-scam ka.

(at least 50 characters)

I-share kung kailan mo una at huling nakausap ang alleged scammer.

Please follow this format: MM/DD/YYYY

Are you trying to recover access to your lost SIM?-

Do you have the following documents? (Valid ID's & Selfie with valid ID's)-

Did you receive an SMS that your account was put on hold due to routine verification?-

Do you have the following documents? (2 Valid ID's & Selfie with 2 valid ID's)-

I hereby declare that the information provided herein are true and correct of my own knowledge. I also understand that any willful dishonesty or untruthful information on my part is a ground for disapproval and/or immediate termination of my account.

Select which statement is most relevant to you-

Incorrect Account Number / Bank

Correct Account Number / Bank

Please share what happened or add other information about your concern

You may attach screenshots or files related to your concern.

I agree to share my personal information with the other party in hopes of resolving our dispute.

I confirm that I own the account and am reporting this fraud incident.

I understand that making a malicious report is prohibited under the Anti-Financial Account Scamming Act (AFASA) Law, or Republic Act No. 12010. I acknowledge that GCash is not responsible for any damages resulting from malicious or erroneous reports.

Tell us more about your verification problems with GCash.

A. Please confirm your identity by submitting a copy of any of the documents listed below.

- Digitally Printed Government-issued ID (NBI Clearance, SSS ID, UMID, Driver's License, etc)
- Passport If your name is different from the document or ID presented, you must supply a copy of documentary evidence to confirm the provided ID (e.g., marriage certificate, change of name deed or statutory declaration).

B. If your request is made by an authorized representative, please confirm the identity of your Authorized Representative by submitting a copy of any of the documents listed below and authorization letter

- Digitally Printed Government-issued ID (NBI Clearance, SSS ID, UMID, Driver's License, etc)
- Passport
- Not Applicable

The data collected here will only be used to validate your identity and process your request for data/account deletion. Once you have completed the form and we've validated your identity, we will process the deletion of your account.

I agree & consent to delete my GCash account linked to my Old No. if I have no unpaid balances in GCredit/GLoan/GGives. I understand that I will LOSE Transaction History, GScore, GForest, Piggy Bank & other Information from my old account.

Yes, I agree

I have attached a clear copy of a Valid ID on the attachment section below

Notarized Affidavit (for funds 1k and above)

I have attached a Notarized Affidavit (required for Non-Fully Verified Old Accounts)

Screenshot of email about your account deactivation

I have attached a screenshot of the email I received from hello@gcash.com

I have attached the accomplished form on the attachment section below

Note: You may download the form via the link from Instruction #2 above.

I have attached a Authorization Letter, Passport or Valid ID of authorized representative on the attachment section below

Please choose a reason below-

When did you buy your sim?

Prepaid or Postpaid-

Is this your personal or company issued phone number?-

Company Name

Complete Address of Branch

Please include region and major island group (Luzon, Visayas, or Mindanao) ex. 999 General Luna St, ABC Village, Brgy 999, Bacoor City, Cavite, Luzon.

Point Person to Receive the Kit

What is the merchant name displayed in the QR?

Store Name

GCash Pera Outlet ID

Date of last verification attempt-

Please provide a screenshot of your verification landing page. To access this, go to your GCash App > Profile > Verify Now

Did you share your MPIN (4 digit number) to anyone?-

Did you share your OTP? (6 digit number)-

Did you share your personal/account information with anyone? Has your MPIN been reset without your knowledge?-

What was the unauthorized transaction made on your account and the total amount being disputed?

Did you share your OTPs from your linked bank account in Gcash?-

Was your GCash account linked to other online applications like Lazada, Shopee, FoodPanda, etc without your consent?-

If yes, what online applications were linked?

How did you pay?-

Card and payment method used-

What card did you use and how did you pay?

Select which statement is most relevant to you-

Location of Purchase-

Was the transaction made locally or internationally?

Anong klaseng scam ang na-experience mo?-

Did you continue with the transaction and paid again?-

Date encountered

If you saw an error code, pleasse input it in this box. If none, put 0

Error codes are usually a combination of 2 letters followed by numbers. Examples are AR861200 or MR502200

What type of error did you experience?-

Others

I certify that I consent to GCash and its partner's processing and updating my mobile number in order for me to access my Account.

I confirm that I did the action to increase my wallet limit but it has been more than 3 days and it still hasn't been upgraded

Valid Government Issued ID (eg. SSS ID, UMID, Driver's License, Passport, etc.)*

I have attached a clear copy of a Valid ID on the attachment section below (required)

Selfie holding your valid ID which clearly shows the details.

I have attached a clear selfie holding my Valid ID on the attachment section below (required)

What Happened in Your Most Recent Verification Attempt-

In which step did you encounter an error?-

Please provide a screenshot of the error you encountered

Nag reach out ka na ba sa merchant about sa iyong concern?-

Please ensure that you've contacted the merchant. If the transaction is successful in our system, you will be requested to reach out to the merchant directly to settle your concern

Natry mo na bang iunlink ang Gcash account mo mula sa merchant?-

You may check our Help Center article for the step-by-step guide on how to unlink your Gcash account from merchants

Anong naging issue when you unlinked your GCash account?-

Screenshot of phone settings showing the mobile number

Screenshot of transaction or error prompt

Take a screenshot of the transaction or error prompt and attach them to this request

I have attached the screenshot of my Phone/SIM Settings showing my GCash number.

I have attached the screenshot of the SMS/e-mail about the linked device

Why do you want to close your account?-

In the textbox below, please include 1) the email address you registered with the merchant, 2) your username or account ID, and 3) the ticket or request number you have with the merchant.

I have uploaded my Valid ID & Selfie holding the valid ID below

Upload a Valid ID accepted in our KYC (<https://help.gcash.com/hc/en-us/articles/900000948786-Accepted-IDs-for-GCash-Verification>)

Have you coordinated with merchant? Did they process the refund on their end and provided an SLA?

I-share kung saan kayo nag-usap ng alleged scammer (ex. Messenger, Viber at name n'ya sa social media or contact number. (e.g. Messenger, Messenger name: GCash Lending)

(at least 15 characters)

I-share kung paano mo nasabi na na-scam ka.

(at least 50 characters)

I-share kung kailan mo una at huling nakausap ang alleged scammer.

Please follow this format: MM/DD/YYYY

Are you trying to recover access to your lost SIM?-

Do you have the following documents? (Valid ID's & Selfie with valid ID's)-

Did you receive an SMS that your account was put on hold due to routine verification?-

Do you have the following documents? (2 Valid ID's & Selfie with 2 valid ID's)-

I hereby declare that the information provided herein are true and correct of my own knowledge. I also understand that any willful dishonesty or untruthful information on my part is a ground for disapproval and/or immediate termination of my account.

Select which statement is most relevant to you-

Incorrect Account Number / Bank

Correct Account Number / Bank

Please share what happened or add other information about your concern

You may attach screenshots or files related to your concern.

I agree to share my personal information with the other party in hopes of resolving our dispute.

I confirm that I own the account and am reporting this fraud incident.

I understand that making a malicious report is prohibited under the Anti-Financial Account Scamming Act (AFASA) Law, or Republic Act No. 12010. I acknowledge that GCash is not responsible for any damages resulting from malicious or erroneous reports.

TERMS AND CONDITIONS FOR AVAILMENT OF PAYONEER-GCASH WITHDRAWAL SERVICE (the “Service”) {#terms-and-conditions-for-availment-of-payoneer-gcash-withdrawal-service-the-“service”}

TERMS AND CONDITIONS FOR AVAILMENT OF PAYONEER-GCASH WITHDRAWAL SERVICE (the “Service”)

1. By linking your Payoneer account to your GCash wallet and availing of the Service, you confirm that you agree to the existing GCash Terms and Conditions and the existing Payoneer’s Legal Policies as defined in <https://www.payoneer.com/legal/> (collectively, the “Agreements”). You agree that all other provisions of the Agreements shall remain in full force and effect except to the extent amended by these terms and conditions.
2. You agree and understand that by linking your Payoneer account and availing of the Service, Payoneer and GCash shall not be held responsible for any loss or damage incurred or suffered by you on account of any (i) failure; (ii) interruption; (iii) defect; or (iv) negligent or willful misuse of the Service; or (v) consequences arising out of delayed or non-receipt of funds withdrawn through the Service.
3. GCash and Payoneer reserve the right, in their discretion, to take any action that may be available to them including to cancel, terminate, modify or suspend the Service

and/or disqualify any customer, at any time with or without notice and without any liability to such customer.

4. You agree and understand that by linking your Payoneer account, your Payoneer information may be disclosed with third parties, including service providers, regulated institutions (e.g., financial institutions), affiliated entities, and business partners such as GCash to assist in carrying out the service.

90L 75 2024

REVENUE MEMORANDUM CIRCULAR NO. 079 - 2024

SUBJECT: Further Extending the Transitory Period Prior to Actual Imposition of Withholding Tax on Gross Remittances Made by Digital Financial Services Providers to Sellers/Merchants Prescribed under Revenue Regulations No. 16-2023

TO

All Revenue Officials, Employees and Others Concerned

The provisions of Revenue Memorandum Circular (RMC) No. 8-2024 prescribed a ninety (90) days transitory period prior to its actual implementation, pursuant to the provisions of Revenue Regulations (RR) No. 16-2023, for purposes of compliance by electronic marketplace operators and digital financial services providers to the relative policies or requirements of other government agencies, if any, and to give them an opportunity to adjust and properly comply with the provisions of the said RR. Subsequently, RMC No. 55-2024 was issued extending its implementation for another 90 days or until July 14, 2024.

In order to provide additional time to the digital financial services providers to finally complete their respective system adjustments for compliance with the requirements of RR No. 16-2023 and other government agencies, if any, the prescribed transitory period is hereby further extended for another ninety (90) days or until October 12, 2024.

Accordingly, all electronic marketplace operators shall impose the withholding of tax to sellers/merchants beginning July 15, 2024.

All revenue official employees and others concerned are hereby enjoined to give the Circular as wide a publicity as possible.

Terms and Conditions for the "Buy and Hold USDC get a chance to Win Php 1M" Promotion {#terms-and-conditions-for-the- "buy-and-hold-usdc-get-a-chance-to-win-php-1m" -promotion}

Promo: Buy and Hold USDC get a chance to Win USDC: Terms and Conditions

Terms and Conditions for the "Buy and Hold USDC get a chance to Win Php 1M" Promotion

1. Promo Overview: Participants can earn raffle entries and a chance to win Php 1,000,000 worth of USDC by maintaining a balance of at least 1 USDC in their GCrypto wallets during the promo period.

2. Promo Mechanics

2.1. How to Participate:

Purchase USDC directly within the GCrypto platform and maintain a balance of at least 1 USDC in your GCrypto wallet to qualify for weekly and grand prize raffle entries.

2.2. Raffle Entry Allocation: Raffle entries are based on the amount of USDC maintained per week:

- \$1 USDC = 1 raffle entry
- \$10 USD = 5 raffle entries
- \$1,000 USD = 50 raffle entries

2.3. Fractional USDC Holdings: For the purpose of determining raffle entries, USDC Holdings will be rounded down to the nearest whole number. A minimum balance of 1 USDC is required to qualify. Holdings between 1.01 and 1.99 USDC will be considered as 1 USDC, holdings between 2.01 and 2.99 USDC will be considered as 2 USDC, and so forth. Holdings below 1 USDC will not be eligible for a raffle entry.

2.4. Weekly Snapshots: Snapshots of USDC holdings will be taken every Sunday at 11:59 PM to calculate raffle entries for the weekly prizes and accumulate points toward the grand prize.

3. Prizes

3.1. Weekly Prizes:

- 50 weekly winners will each receive 20 USDC.
- Weekly winners will be announced on the Wednesday following the snapshot.
- Prizes will be credited to the winners' GCrypto wallets within 7 working days of the announcement.

3.2. Grand Prize:

- One winner will receive Php 1,000,000 worth of USDC.
- To qualify for the grand prize, participants must hold at least 1 USDC by 27 April 2025 at 11:59 PM.
- The grand prize will be credited to the winner's GCrypto wallet within 7 working days from the official announcement of the winner.

4. Eligibility

4.1. Qualified Participants:

The Promotion is open to all GCrypto users who are Know Your Customer (KYC)-verified and legal residents

of the Philippines, aged 18 years or older, who hold a minimum of 1 USDC in their GCrypto wallet at the

time of entry.

The following individuals and entities are excluded from participation:

- Employees of the promoter and promoter's partner, including their affiliates, subsidiaries, and representatives, as well as their family members up to the third degree of consanguinity;
- Agents of the promoter and promoter's partner, including their affiliates and subsidiary companies, as well as their family members;

- Any person or entity professionally connected with this promotion; and
- Any person prohibited from participating under any applicable statute, law, regulation, ordinance, rule, directive, guideline, policy, or governmental restriction in the Philippines.

Cryptocurrency transactions are subject to market risks. This Promotion is purely a marketing campaign and does not constitute an endorsement of USDC or any other digital asset. Crypto assets are not insured by the Philippine Deposit Insurance Corporation (PDIC).

5. Promo Schedule and Period: Between March 3, 2025 to April 27, 2025

5.1. Weekly Raffle Snapshots:

- Week 1: March 9, 2025
- Week 2: March 16, 2025
- Week 3: March 23, 2025
- Week 4: March 30, 2025
- Week 5: April 6, 2025
- Week 6: April 13, 2025

Week 7: April 20, 2025

5.2. Grand Raffle Snapshot: April 27, 2025, at 11:59 PM.

6. Tokens Eligible for the Promo

- USDC on Ethereum
- USDC on Solana
- USDC on Base

7. Prize Distribution

- All prizes will be distributed in USDC and transferred to the winners' GCrypto wallets.

- Weekly prizes will be credited within 7 working days after the official announcement of the winners.
- The grand prize will be credited within 7 working days after the official grand prize announcement.

8. Additional Terms

8.1. Promo Changes:

GCrypto reserves the right to modify, suspend, or terminate the promotion.

This promotion is not an investment scheme, financial product, or securities offering. Participating in the raffle does not guarantee any financial return. The value of USDC and other cryptocurrencies may fluctuate.

Participants should not consider their USDC holdings for this promotion as an investment opportunity or securities offering.

8.2. Fraud Prevention: Any attempt to defraud or abuse the promo will result in disqualification and will lead to account suspension.

8.3. Announcement of Winners:

Participant acknowledges and consents that by participating in this promo, Participant's name will be published if he/she is declared a winner.

9. For inquiries or concerns, please visit GCash Help Center: (Use this hyperlink: <https://help.gcash.com/hc/en-us/p/contact-us>).

Cryptocurrency transactions are subject to market risks. This promotion is not an endorsement of USDC or any digital asset. Crypto assets are not insured by the Philippine Deposit Insurance Corporation (PDIC).

By participating in this promotion, participants agree to release, indemnify, and hold harmless GCrypto, its parent company, affiliates, officers, employees, and agents from any claims, damages, losses, or liabilities arising from:

- a) Incorrect or inaccurate participant information;
- b) Technical failures, system malfunctions, or third-party platform issues affecting USDC transactions;
- c) Errors, delays, or unforeseen issues in raffle administration, winner selection, or prize distribution beyond GCrypto's control;
- d) USDC price fluctuations and market volatility;

- e) Unauthorized access, fraud, hacking, phishing, or security breaches beyond GCrypto's control;
- f) Regulatory restrictions, legal changes, or external factors affecting the promotion and prize availability; and
- g) Other circumstances beyond the control of GCrypto.

GCrypto makes no warranties on the stability, liquidity, or future value of USDC. Participants acknowledge all risks associated with virtual assets, including potential loss of value. GCrypto shall not be liable for any claims arising from market conditions, regulatory actions, or unforeseen events beyond its control.

If you tried to withdraw money with your GCash Card but the ATM didn't release the cash, the ATM might have been **out of cash or encountered an error** during the transaction.

In this case, your money will be refunded to your GCash wallet within **1-2 working days**. GCash will work with our partner banks to fix these issues and process the refund.

If the bank confirms that the **withdrawal was successful**, an investigation will be conducted, which may take up to 10 banking days.

If the bank confirms that the **withdrawal was not successful**, the refund should appear in your GCash wallet within **2 working days**.

If you still haven't received your refund after 2 working days, [click here to ask for help](#). A customer service representative will contact you in **24 hours**.

If you're trying to create a GCash account but it says your number is already in use, it means the SIM card has been used before, and someone else had a GCash account with that number.

To continue creating your GCash account, [click here to ask for help](#), and include these details:

- Telco network
- SIM purchase date
- Prepaid or postpaid status:

Prepaid subscriber: Attach a screenshot of your phone's settings showing your number or a photo of the SIM card.

Postpaid subscriber: Attach a statement of account from your service provider.

Once submitted, a customer service representative will contact you in **24 hours**.

Bumili ng vouchers para i-top up ang inyong Grab o Angkas wallet. Ang service na ito ay para lang sa official drivers ng Grab at Angkas.

Paano mag top up gamit ang GCash

1. Pindutin ang **Bills** sa GCash homepage
2. Sa search bar, hanapin ang **Grab Driver Voucher** or **Angkas Biker Voucher**
3. I-confirm na ikaw ay isang Grab o Angkas driver at ilagay ang top up amount at mobile number
4. Siguraduhing tama ang mga detalyeng inilagay at pindutin ang **Confirm**

Makukuha mo ang top up voucher code via SMS sa mobile number na nilagay mo.

Need more help?

Pumili ng isa sa sumusunod ayon sa isyu na nararanasan mo para humingi ng tulong sa amin:

- [Unable to buy vouchers \(Di makabili ng voucher\)](#)
- [Cannot redeem the voucher code that was sent \(Di ma-redeem ang voucher code\)](#)
- [Haven't received the voucher code \(Di pa nakuha ang voucher code\)](#)
- [Transacted a wrong top-up. \(i.e Grab instead of Angkas wallet or vice versa\) \(Maling top up\)](#)

The wallet and transaction limits of your GCash account depend on your GCash Profile. Your transaction limits reset **every 1st day of the month**. Find out more about your GCash Wallet and Transaction Limits below.

Different Limits for your GCash Account

- **Wallet limit** - Maximum amount of funds that you can keep in your GCash
 - **Incoming Transaction Limit** - Maximum amount that you can receive in your GCash Wallet (ex: Cash In, Receive Money)
 - **Outgoing Transaction Limit** - Maximum amount that you can send to another GCash Wallet, bank, or withdrawal (ex: Send Money, Bank Transfer, Cash Out)
 - **Express Send Transaction Count Limit** - A monthly limit on the number of send & receive transactions for Express Send
 - **GCash Card Limits** - Maximum amount per transaction or per withdrawal via ATM
 - **GSave Transaction Limits** - Maximum amount that you can deposit or withdraw from your GSave account

Specific Limits per GCash Profile

PHP 1,000,000 || **Outgoing Transaction Limit**(Maximum amount that can be spent and sent in a GCash Wallet) || Daily | None | PHP 10,000 | PHP 100,000 | PHP 100,000 | PHP 500,000 || Monthly | PHP 5,000 | PHP 10,000 | None | None | PHP 1,000,000 |

- [How do I send money to another GCash account?](#)

For GCash Borrow Load, there is a **one-time processing fee** for every time you borrow and **late payment penalty fees** if you pay after your due date. Check the processing fee and sample computation for late payment penalty fees below:

Processing Fee: A processing fee of **PHP 19.00 is charged on top of your convenience fee** (for SMART & TNT promos) for every Borrow Load transaction.

Late Payment Penalty: A late payment penalty equivalent to **2.5% of your outstanding balance** will be charged at **three intervals** if you miss your repayment due date:

- 1 day after the due date
- 31 days after the due date
- 61 days after the due date

Sample Late Payment Penalty Computation

For a borrowed load with a principal amount of PHP 100.00

- **Initial Borrowed Amount:** PHP 100.00
- **Processing Fee:** PHP 19.00
- **Total Amount Due on Due Date:** PHP 119.00

If you fail to pay on your due date, your late payment fees will be as follows:

1 Day Late:

- Penalty: 2.5% of PHP 100.00 = PHP 2.50
- Total Amount Due: PHP 119.00 + PHP 2.50 = PHP 121.50

31 Days Late:

- Additional Penalty: 2.5% of PHP 100.00 = PHP 2.50
- Total Amount Due: PHP 121.50 + PHP 2.50 = PHP 124.00

61 Days Late:

- Additional Penalty: 2.5% of PHP 100.00 = PHP 2.50
- Total Amount Due: PHP 124.00 + PHP 2.50 = PHP 126.50

Following the sample computation above, if you make your payment **61 days after your due date**, the total amount due would be **PHP 126.50** (for a borrowed load of P100.00).

To avoid any late payment penalty fee, please ensure timely repayments. If you have any concerns, you may [click here to ask for help](#) and a customer service representative will contact you in **1-2 working days**.

Adding money to your GCash wallet is called "cashing in." Each cash-in method may have its own fee. Here's a quick guide to help you understand these fees:

Cash In via Linked Bank/Digital Wallet Account

A convenience fee will be charged for every cash in from linked accounts. The fees are as follows:

 BANK FEES EFFECTIVITY DATE 	 --- --- --- 	 BPI PHP 5 October 2, 2023
 UnionBank PHP 5 May 27, 2024 	 PayPal 1% of the Cash In amount 	March 4, 2024
 Payoneer 1% of the Cash In amount 	October 30, 2024 	

Cash In via Online Banking

Bank via InstaPay

GCash is partnered with over 40 banks. You can add funds through your bank's website or app using InstaPay. Handling fees may apply.

PayPal

You can cash in directly from your PayPal account. [Click here](#) to know how.

Cash In via Over-The-Counter

FREE for up to PHP 8,000 per month

2% fee for any exceeding amount per month

Note: Your FREE Cash In limit via over-the-counter outlets resets on the first day of the month.

Check out the sample computation below for over-the-counter cash in transactions:

||||| --- | --- | --- | | **May 1**

You cashed in Php 7,000 over-the-counter as your first cash-in for May.

As you are below the limit this is **FREE** and you will receive Php 7,000 in your GCash wallet. | The month of May Cash In | 0 | | New Cash In Transaction | 7,000 | | Monthly Free Limit | 8,000 | | Is Transaction Above Limit? | No | | Amount Above Limit | 0.00 | | Service Fee (2%) | 0.00 | | Amount Credited | 7,000 | | | | | **May 5**

You cashed in Php 1,100.

Since you have already cashed in Php 7,000 before, the additional Php 1,100 would mean you've reached the Php 8,000 limit.

Only the amount above the limit, Php 100, is subject to the 2% service fee, so the computation would be: $100 \times 0.02 = \text{Php } 2$ service fee. | May Cash In | 7,000 | | New Cash In Transaction | 1,100 | | Monthly Free Limit | 8,000 | | Is Transaction Above Limit? | Yes | | Amount Above Limit | 100 | | Service Fee (2%) | 2 | | Total Amount Credited | 1,098 | | | | | **June 1**

You cashed in Php 5,000. Since the P8,000 cash-in limit refreshes monthly, you will receive your total cash-in amount, of Php 5,000. | June Cash In | 0 | | New Cash In Transaction | 5,000 | | Monthly Free Limit | 8,000 | | Is Transaction Above Limit? | No | | Amount Above Limit | 0.00 | | Service Fee (2%) | 0.00 | | Total Amount Credited | 5,000 |

Cash In via Remittance

Cashing in via remittance is **FREE**. [Click here](#) to know how you can send/receive remittance with GCash.

If you have other concerns with your Cash In transactions, [click here to ask for help](#). A customer service representative will contact you within **1-2 business days**.

Check out the information below to learn more about the fees for GFunds:

- **Transaction Fees:** GCash does not charge any transaction fees. You may place a Buy or Sell order anytime on the platform for free.
- **Annual Management Fees:** Our partner providers charge a small annual management fee for your total investments. This fee is automatically computed and incorporated into the daily NAVPU and market value of your investments.

The different annual trust fees for each fund are as follows:

Fund Name	Annual Trust Fee
ATRAM Philippine Sustainable Development and Growth Fund	1.75%
ATRAM Global Equity Opportunity Feeder Fund	1.15%
ATRAM Global Health Care Feeder Fund	1.15%
ATRAM Global Infra Equity Feeder Fund	1.15%
ATRAM Global Technology Feeder Fund	1.15%
ATRAM Global Consumer Trends Fund	1.15%
ATRAM Philippine Equity Smart Index Fund	1.50%
ATRAM Total Return Peso Bond Fund	1.10%
Philippine Stock Index Fund	1%
ALFM Global Multi-Asset Income Fund	1.50%
ATRAM Peso Money Market Fund	0.50%

Check out the information below to learn more about the interest rates and fees for GGives:

- **Interest Fees:** Between **0%** and **5.49%** per month, depending on your eligibility and loan term.
- **Late Payment Fee:** 1% of your loan amount for each missed due date, plus 0.15% of your total outstanding balance each day until it's paid off.

Visit your GGives dashboard and tap on your GGives loan to see a breakdown of your monthly payments and fees.

Sample computation for a loan with a late payment fee:

Date of Purchase: June 10

Purchase Amount: P10,000 (Your principal balance)

No. of months to pay: 6 months

Monthly payment to GGives: P2,015.67 (principal balance + monthly interest) Monthly due date: 10th of the month

Sample date of Payments:

June 10 - n/a

July 10 - Amount to pay: P2,015.67 (**On-time payment**)

August 10 - No Payment made

August 15 - Amount to pay: P2,178.17 (**Late Payment**)

Late payment Fee Sample Computation:

(1% x PHP10,000) + (0.15% * 8,333.33 * 5 days)

= **P162.50**

Late Payment Fee Computation

(1% of the principal balance) + (0.15% of outstanding principal balance * number of days missed from the due date)

The interest rate annually in GSave by CIMB is **2.6%** with no minimum deposit and no maintaining balance.

Example Scenario:

Month eligible for 8% p.a. NTB Promo: December onwards

To calculate interest amount = (Average Daily Balance x Incremental Interest Rate x Number of days in a month) / 360) x [1- Withholding Tax (20%)]

Sample computation eligible for 8% p.a.

Average Daily Balance: | 10,000 | | Incremental Interest Rate: | 5.4% p.a.
(8% p.a. less base rate of 2.6% p.a.) | | Number of days in a month: | 31 | | Net Interest Earn: | $(10,000 \times 0.054 \times 31) / 360 \times 0.8 = \text{Php } 37.20$ |

Note: The additional interest earned will be credited to their respective GSave Account within **fourteen (14) business days** after each qualifying month. It will be in the form of account credit on top of the regular monthly base interest payout of **2.6% p.a.**

You may be charged a cash or property dividend tax in GStocks PH. See detailed information below for applicable cash or property dividend tax for local and resident foreign corporations:

||||---|---|| **Criteria | Final Withholding Tax** || Philippine Citizen or a Resident Foreigner | 10% on the gross amount of dividends received || Non-resident foreigners engaged in business or trade in the Philippines | 20% on the gross amount of dividends received || Non-resident foreigner not engaged in trade or business in the Philippines | 25% on the gross amount of dividends received |

Cases where residing foreign corporation cash or property dividend tax is applicable

- **Tax Rates for Residents of Treaty Countries:** If you're from a country that has a tax treaty with the Philippines, the [tax rate on dividends](#) will follow the treaty, as long as you submit all required documents.
- **Non-Resident Foreign Corporations/Individuals:** Dividends (cash or property) from a Philippine company are usually taxed at **25%**. This can be lowered to 15% if your country allows you to claim the Philippine tax as a credit, and you submit all needed documents.
- **Tax Treaty Rules:** If there's a tax treaty between the Philippines and your country, the treaty's lower tax rates apply. Without a treaty, standard Philippine tax rates will be used.
- **How to Apply for Tax Treaty Benefits:** To use the treaty's benefits, you must submit a form (BIR Form No. 0901) at least 15 days before the transaction. Attach the required documents to explain why you qualify.

Note: These rules apply only to taxes on dividends.

If you pre-terminate your time deposit account with #UNOReady@GCash by UNO Bank, a **pre-termination penalty fee** will be charged to you. Check out the penalty fees below:

|||| --- | --- || **Documentary Stamp Tax (DST) charge | Pre-termination Penalty** ||
PHP 1.50 for every PHP 200 of the principal amount. | 50% of gross interest earned if pre-terminated at the first half of the tenure || For time deposits with tenure of less than 1 year:

DST = (Original Tenure in Days / 365*) x (1.50 / 200) x Principal Amount
 *366 for a leap year | 25% of gross interest earned if pre-terminated at the second half of the tenure |

You may only withdraw the **full amount** of your time deposit.

- [How do I send money to another GCash account?](#)

GCredit interest rates range from **5% to 7%**, depending on how active you are on GCash. The more you use GCash, the lower your interest rate could be.

GCredit Interest Charges

Interest charges **start the day after a transaction is made** using GCredit.

The interest is calculated based on the number of days the amount is borrowed.

How to calculate GCredit interest rate

Refer to the example below to calculate your GCredit interest rate.

1. **Transaction Date:** October 1
2. **Amount Borrowed:** PHP 1,000
3. **Interest Rate:** 5%
4. **Payment Date:** October 10

Interest Calculation:

- Number of days borrowed: 9 days (October 2 to October 10)
- Daily interest rate: 5% monthly rate/ 30 days = 0.17% per day

Total interest: PHP 1,000 * 0.17% * 9 days = **PHP 15**

Total Outstanding Balance: PHP 1,000 (principal) + PHP 15 (interest) =

PHP 1,015.00

Note:

If the GCredit dues are paid within the same day of the transaction, no interest charges will be applied.

Learn how to fully verify your GCash account with this step-by-step guide! This quick tutorial covers the GCash verification process, requirements, and tips to complete your GCash account setup easily through the app within 3 days.

What are the requirements for verification?

One valid government ID. Make sure your ID is NOT damaged or expired.

Minors and foreign nationals may also need to submit additional documents.

How do I verify my GCash account?

Tap which scenario applies to you to find out how to have your GCash Account Fully Verified:

Filipino Citizen 18+ years old with PH Sim

1. On your GCash app, tap **Profile > Verify Now**
2. Tap **Get Started**
3. Read through all the requirements and reminders. Tap **Next**
4. Enter the 6-digit authentication code sent to your mobile number. Tap **Next**
5. Input your birthday and confirm if you are a Filipino citizen. Tap **Next**
6. Select the government ID you wish to submit for verification. Tap **Select ID**
7. Scan your ID and take a selfie scan
8. Review your account information and tap **Submit**

You'll be led to a page that confirms your application to be fully verified.

Minor (Filipino) 7-17 years old with a PH Sim

Note: In order to proceed with verification, please make sure your parent is a Fully Verified GCash user.

1. On your GCash app, tap **Profile > Verify Now**
2. Tap **Get Started**
3. Read through all the requirements and reminders. Tap **Next**
4. Enter the 6-digit authentication code sent to your mobile number. Tap **Next**
5. Input your birthday and confirm if you are a Filipino citizen. Tap **Next**
6. Select the government ID you wish to submit for verification. Tap **Select ID**
7. Scan your ID and take a selfie scan
8. Review your account information and tap **Confirm**
9. Upload a selfie of your parent holding your ID and a photo of your original or copy of your PSA Birth Certificate
10. Review your account information and tap **Submit**

You'll be led to a page that confirms your application to be fully verified.

Foreign National with a PH Sim

Note: In order to proceed with verification, please make sure you have your Alien/Immigrant Certificate of Registration.

1. On your GCash app, tap **Profile > Verify Now**
2. Tap **Get Started**
3. Read through all the requirements and reminders. Tap **Next**
4. Enter the 6-digit authentication code sent to your mobile number. Tap **Next**
5. Input your birthday and choose your nationality. Tap **Next**
6. Select the government ID you wish to submit for verification. Tap **Select ID**
7. Scan your ID and take a selfie scan
8. Review your account information and tap **Submit**

You'll be led to a page that confirms your application to be fully verified.

You will receive an update about your verification after **3 days**.

If you are a Filipino GCash user with a foreign sim, you can [click here to learn how to Get Fully Verified with GCash overseas](#).

The GCash Card is available only to Fully Verified GCash users. It's a **prepaid debit card** linked to your GCash account, offering a range of benefits, including secure access to your funds. The card is personalized with your name, based on the information you provided during verification.

Services available with GCash Card:

- 1. Manage your funds:** You can **link your GCash Card directly to your GCash Account** through the app.
- 2. Pay globally:** You have various transaction options with your GCash Card, allowing you to make payments at **over 35.9 million merchants**. - The GCash VISA/Mastercard card has **no foreign exchange fee** for international transactions, but the **exchange rate at the time of purchase will apply**. You can check the GCash app for the conversion of your wallet balance to the current foreign exchange rate.
- 3. Withdraw cash easily:** You can withdraw money from any BancNet ATM in the Philippines and card-enabled ATMs worldwide.

Verifying your GCash account is important to access all its services and improve security.

In line with Bangko Sentral ng Pilipinas (BSP) rules and regulations, **GCash users must verify their account/s within 12 months**. If you don't, you might face fees or your account could be closed.

Here's what could happen if you don't fully verify your GCash account.

Limited Access to GCash Features

If you don't fully verify your GCash account, your access will be restricted to basic services only, such as:

- **Cash In**
- **Pay Bills**
- **Buy Load**
- **Offline Cash-In**
- **Receive Money**

To learn more about features with a Fully Verified GCash account, [click here](#).

Account Closure

After 12 months without verification:

1. **If Your GCash Wallet Balance is Zero:** - Your account will be **closed**
2. **If you have money left in your GCash Wallet Balance:** - Your account will be temporarily **suspended/restricted**. You won't be able to log in or use GCash services
 - A monthly " **Basic Account Maintenance Fee**" of **PHP 15** will be applied to keep your account active in our system. This fee will continue to be charged until your wallet balance is depleted.
 - Once your balance reaches zero, your **account will be closed**, and you will lose access to GCash.

Note:

The Basic Account Maintenance Fee is a **monthly charge of PHP 15 for suspended GCash basic accounts**, effective from the date specified in the email. This fee contributes to the management of unverified accounts.

Next Steps:

To use GCash again, you must create a new GCash account and get fully verified.

If you want to claim the funds from your deactivated GCash basic account, please follow the steps found in "How to Claim My Funds from a Restricted Basic GCash Account."

When you pay your full GGives dues early, you can get back some of the interest you paid, plus your GGives credit limit and loan count limit will be reset so you can borrow again, if you are still qualified for GGives.

Here's how it works:

Interest Cashback

If you fully pay off your GGives loan **at least one (1) month before your last GGives payment date**, you'll get interest cashback for the number of months remaining in your original payment schedule.

You'll get the cashback credited to your GCash wallet within **14 business days** after you pay, and you'll get an SMS letting you know.

Check out a sample payment schedule below:

Due Date of Final GGives Payment: July 20, 2023

GGives Fully Paid: May 19, 2023

Cashback Coverage: The total cashback will be your interest for months June and July

Replenish your loan limits

You can replenish your GGives amount and loan count limits which will allow you to avail for another GGives loan, as long as you are still qualified.

Increases and changes to your loan offers will be evaluated regularly to ensure you have the best options available.

When you pay your full GLoan dues early, you can get back some of the interest you paid, plus your GLoan limit will be reset so you can borrow again. Here's how it works:

Get interest cashback

If you pay off your GLoan before your last GLoan payment date, you'll get interest cashback for the months you didn't use.

To qualify for this, make sure to pay off your loan at least one month before your last payment is due.

You'll get the cashback credited to your GCash wallet within **14 business days** after you pay, and you'll get an SMS letting you know.

Check out a sample payment schedule below:

- **Date of Final GLoan Payment:** November 8, 2025
- **GLoan fully paid:** July 10, 2025
- **Cashback Coverage:** September to November (3 months)
- **Total cashback amount of interest:** PHP 346.18

Replenish your loan limits

You can replenish your GLoan amount and loan count limits, which will allow you to avail another GLoan, as long as you are eligible.

*Increases and changes to your loan offers are not guaranteed, and will be evaluated to ensure you have the best options available.

DoubleSafe is a GCash security feature that **uses selfie scans to protect your account from unauthorized access**.

Before taking your selfie scan, please make sure to:

- Take a photo in a well-lit room
- Do not cover your full face and make sure you are recognizable
- Ensure that there are no people in the background
- Wear proper attire

For your security, you may be locked out of your account after **5 failed attempts for 24 hours**.

PocketPay is a mobile application under the GCash for Business suite designed to transform NFC-enabled smartphones into payment terminals, allowing merchants to accept card payments directly from their devices. This app enables a seamless and efficient transaction process, leveraging contactless payment technologies.

Key Features of PocketPay:

Card Payment Acceptance: Users can accept card payments using their NFC-enabled Android phones, providing a portable solution for on-the-go transactions.

Secure Login: Users can log in to the PocketPay app using their email or phone number, bolstered by multi-factor authentication to enhance security.

Flexible Receipt Options: Users have the option to receive receipts via SMS or email.

Transaction Management: Users can manage command actions, including processing returns or refunds, directly through the mobile platform.

How do I set up PocketPay for my business?

1. **Download the PocketPay App:** Ensure that your business uses an NFC-enabled Android phone. Download the PocketPay app from the Google Play Store.
2. **Create a GCash for Business Account:** If you do not already have one, register for a GCash for Business account. This is necessary as PocketPay is linked to your GCash for Business account. ([Link to How to apply for GCash for Business account](#))
3. **Log in to the PocketPay App:** Open the PocketPay app and log in using your email or phone number associated with your GCash for Business account. Multi-factor authentication (MFA) and one-device binding are implemented to ensure a secure login experience .
4. **Set Up Your Payment Terminal:** Follow the in-app prompts to transform your NFC-enabled Android phone into a payment terminal. Ensure that your device is configured to accept card payments directly.
5. **Test Transactions:** Conduct a test transaction to ensure that the app is working correctly and can process payments from your customers. This step is crucial to verify that your setup is complete and operational.
6. **Customization and Training:** Familiarize yourself with the features of the app, such as generating electronic receipts (SMS or email) and managing returns or refunds through the mobile platform

How can I delete my PocketPay account linked to my smartphone?

To initiate the deletion of your PocketPay account, you must have a GCash for Business linked to your PocketPay app.

R equest Deletion:

Prepare the necessary details in order to successfully request for account deletion:

- Mobile number linked to PocketPay account
- Email used to sign up for a GCash for Business account
- Reason for deleting PocketPay account:
 - I no longer wish to use the PocketPay app
 - I am not happy with the product
 - My device linked to the PocketPay terminal is stolen
 - My device linked to the PocketPay terminal is lost
 - Others

Submit Request:

Once you have prepared the requirements, please email partnersupport@gcash.com. Please note that once your account has been deleted, you will need to go through the account linking process once again.

A customer service representative will review the details you shared and work on your request. Your profile will be updated within 3 days, and you'll receive an SMS confirmation on your GCash-registered number.

GSav e Quick Save is a feature that lets GCash users view, access, and quickly deposit funds directly from the Savings dashboard. This feature is available only to GSav e by CIMB as of writing. You can use this feature by following the steps below:

For users without a GSav e by CIMB account:

1. On your GCash app, tap your **Savings** dashboard
2. Click **Save Now**

For users with a GSave by CIMB account:

1. On your GCash app, tap your **Savings** dashboard
2. Click **Quick Save > GSave by CIMB**
3. Deposit funds from your GCash wallet to your GSave by CIMB account

If you're having trouble viewing your balance, simply pull down the screen, tap the refresh button located in the balance bar, or restart your GCash app.

Sharetreats is a voucher marketplace within GCash that allows you to easily send treats to your friends and loved ones. You can access Sharetreats conveniently through GLife to purchase and share a variety of vouchers.

Tap a tab below to learn more about Sharetreats:

Eligibility to Use Sharetreats

To use Sharetreats, you must be a [Fully Verified](#) GCash user

How to Purchase Sharetreats Vouchers on GLife

Double-check all details before completing your purchase, as transactions **cannot be canceled** once processed.

1. On the GCash homepage, tap **GLife** and search for **Sharetreats**
2. Browse the available brands and select the voucher you want to purchase
3. Provide the recipient's details (ensure they are **located in the Philippines**)
4. Tap **Pay with GCash** and review the payment amount and details

Once your transaction is processed, the recipient will receive the voucher within **3–5 minutes**.

How to view Sharetreats Vouchers

1. On the GCash homepage, tap **GLife** and search for **Sharetreats**
2. On the Sharetreats homepage, tap **Home**
3. Select **Treats Sent** to view the vouchers you've shared

Recipients will receive the following via SMS and email:

- Instructions on how to redeem the voucher
- The unique voucher code to provide at the shop or store.
- Terms and conditions of Sharetreats

What to do if vouchers are not received

If the recipient did not receive the voucher, follow these steps:

1. On the **Sharetreats homepage**, tap **Home**
2. Select **Treats Sent**
3. Tap **SMS/Email resend** to resend the voucher

If the recipient still did not receive the voucher within 3-5 minutes, please contact the Sharetreats customer service directly.

How to Contact Sharetreats

SoundPay is a payment solution from GCash for Business, designed for small and medium businesses (MSMEs). These features upgrade the old Scan-to-Pay method, giving merchants easier and faster ways to accept payments.

SoundPay plays a sound to confirm successful payments so merchants can hear when a transaction goes through.

To use Soundpay, [register for GCash for Business on the official GCash website.](#)

Your #UNOready@GCash by UNOBank time deposit account lets you earn **higher interest rates than your regular savings account**. The interest rates with #UNOready@GCash by UNOBank time deposits depend on your product and chosen term. You can refer to the table below for more details:

Interest Rates Computation

Product	Gross Interest Rate per Annum	(Paid out at the end of your term)	Term Option	Minimum Amount	Maximum Amount	No. of Time Deposits Allowed	#UNOboost@GCash	4.50%	3 - 5 months	PHP 5,000	PHP 100,000	5	4.75%	6 - 11 months	5.00%	12 months	#UNOearn@GCash	5.00%	12 months	PHP 5,000	PHP 100,000	5	5.25%	24 months

Interest earned from your time deposit accounts is subject to a **20% withholding tax**.

How to book a time deposit

You can book a time deposit by following these steps:

1. On your #UNOready@GCash by UNOBank dashboard, tap **Add Time Deposit**
2. Select the type of time deposit > **Apply Now**
3. Read about the details of the product > **Apply Now**
4. Input the amount you'll deposit and select the tenure of your time deposit > **Next**
5. Review the details of your time deposit > **Confirm**

A page will appear to confirm the success of your time deposit. Funds will be deducted from your #UNOready@GCash by UNOBank account in **real time**.

The Express Send Transaction Limit is a monthly limit that is placed on the number of send & receive transactions you can perform using Express Send.

How Does the Express Send Transaction Limit Work?

At the start of each month, you'll receive a **set limit of 550 Send & 500 Receive transactions with Express Send.**

You won't be able to make any Express Send transactions for the rest of the month after you reach BOTH of these limits.

You can send and receive transactions again at the beginning of the following month. The same limits apply until you hit the maximum number of transactions.

If you are a merchant and want to use GCash without transaction limits, we encourage you to sign up for a [GCash Pera Outlet](#) account.

The GCrypto Trading Wallet is a separate wallet designed for trading cryptocurrency and is **different from your regular GCash wallet**. It allows you to:

- Convert PHP to crypto and crypto back to PHP
- Manage your funds for crypto transactions

How to Track Your GCrypto Transactions:

- Check your **GCash App Inbox** and **GCash Transaction History** for any top-up or withdrawal confirmation.
- To view your crypto assets, tap **Portfolio**

Reminders:

- You *cannot* directly transfer or buy crypto using your GCash Wallet
- To buy crypto, you need to [top up your GCrypto Trading Wallet](#) first

The **Net Asset Value Per Unit (NAVPU)** tells you the **price per unit** of a fund. This value **may increase or decrease daily**, depending on how well the fund's investments are doing in the market.

NAVPU is computed by dividing the **fund's overall value by the total number of units the fund has**.

Sample Calculation Suppose a fund has a total net value of PHP 50 million and has 5 million units. The NAVPU would be:

If the value of the fund increases to PHP 55 million the next day, the NAVPU will rise to **PHP 11.00**.

The **Risk Profile Questionnaire (RPQ)** is a quiz required for signing up for **GInvest products such as GCrypto, GStocks PH, and GFunds** that helps you figure out what type of investor you are. It checks how comfortable you are with taking risks when investing your money and helps guide your decisions in GFunds.

Note: Opening and maintaining any GFunds account will qualify you for a GCash wallet and transaction limit increase to PHP500,000.

Before you can invest in GFunds, you need to take the Risk Profile Questionnaire. It ensures that you understand the risks involved and helps you make better investment choices based on your financial goals and risk acceptance level.

Types of Risk Profiles

Here are the three risk profiles you might receive:

| **Risk Profile | Description** | | --- | --- | | Conservative | You prefer safety over high returns. Your main goal is to protect your money, even if it means earning less. | | Moderate | You're okay with some ups and downs. You aim for a balance between protecting your money and growing it over time. | | Aggressive | You're willing to take big risks for the chance of higher returns, knowing that you could lose money along the way. |

Key Reminders

- Once completed, you **cannot retake** the Risk Profile Questionnaire (RPQ) or change your risk profile for **three years** unless GFunds require you to retake it.
- Your risk profile is a guide when selecting funds. You can still invest in funds with a higher risk than your profile, but you must **confirm a waiver prompt** on the GCash app before proceeding.

Here are the questions you will encounter in the Risk Profile Questionnaire:

| **Question | Definition** | | --- | --- | | What is your net worth? (approximate) | Your net worth is the total value of your assets (savings account, checking account, investments, etc.) minus your total debts (mortgage payments, car loans, etc.). | | What is the source of your funds? | Your source of funds is where your money for investing will come from. If the source of your funds is not stated, kindly specify under the “Others” checkbox. | | What is the purpose of your investment? | The purpose of your investment is the reason why you want to invest. Here are the options available and what they mean.
 - To prevent capital loss while generating income, - if you want to protect the value of your money from inflation.
 - To have a regular income source - if you want to regularly earn from investing.
 - To generate significant capital appreciation - If you want to see your money grow over time. | | How much do you see yourself investing? | The amount of money you plan to invest or are comfortable with investing | | How frequently do you see yourself investing?
 | Investing is not recommended as a one-time payment only. It is always best to grow

your wealth by investing regularly. || Investment horizon.

You are investing for a period of... | Investment horizon is the amount of time you'll be keeping your investment in your GFunds account before you convert it to cash. || Risk Scenario:

How much of a drop/loss in the value of your investment can you accept? | A risk scenario at 0% is considered very low risk, whereas more than 15% is high risk. Anything in between is considered moderate risk. || Your investment principle | Your investment principle will determine the amount of risk you are willing to take for a certain amount of return. || How knowledgeable are you as an investor? | The level of information you have on the act of investing || Which of the following have you invested in? | - Cash and deposit products (e.g. time deposit, SDA)

- Government securities or corporate fixed-income securities (e.g. T-bills, Retail Treasury Bonds, corporate bonds, commercial papers)
- Stocks
- Mutual funds or UITFs
- Insurance products (including variable unit linked products and pre-need)
- Offshore funds (including ETFs, REITs)
- Structured financial products
- Commodities
- Real estate || Do you have a regular liquidity requirement? | You have a regular liquidity requirement if you will get cash from your investment regularly. |

The annual interest rate in GSave by CIMB is **2.6%** with **no minimum deposit** and **no maintaining balance** needed.

Example Promo Scenario:

Eligible for 8% p.a. NTB promo: December onwards

Average Daily Balance (ADB) x Incremental Interest Rate x Number of days in a month / 360) x [1 - Withholding Tax (20%)] = **your interest**
\

Sample computation eligible for 8% p.a.:\\

Sample computation eligible for 8% p.a.

```
|||
| --- | --- |
| ADB: | 10,000 |
| Incremental Interest Rate: | 5.4% p.a. (8% p.a. less base rate of 2.6% p.a.) |
| No. of days in a month: | 31 |
| Net interest to be earned | (10,000 x 0.054 x 31) / 360 x 0.8 = Php 37.20 |
```

Note: The additional interest earned will be credited to your respective GSav account within **fourteen (14) business days** after each qualifying month. You will receive your interest as account credit on top of the regular monthly base interest payout of **2.6% p.a..**

The annual interest in #UNOready@GCash by UNOBank is **3.25 %** with **no minimum deposit** and **no maintaining balance**. To increase your interest rate to **3.75%**, please maintain at least PHP 5,000 in your account.

You must have a maintaining balance of at least PHP 0.01 to earn interest. Interest earned will be credited daily to your account.

See below for the interest rates and sample computation:

	--- --- ---	End-of-Day Balance	Interest Rate	From To	PHP 0.01 PHP
4,999.99	3.25%	PHP 5,000.00	PHP 4,999,999.99	3.75%	PHP 5,000,000.00
Above PHP 5M			1.00%		

Gross Interest Earned = Principal Amount x Interest Rate x (1/ number of days in a year)

Sample computation:

- At the end of the day, you have PHP 5,000 in your #UNOready@GCash by UNOBank account
- Interest rate: 3.75%
- Interest earned for 1 day = PHP 5,000 x 3.75% x (1/365) = **PHP 0.51**

The minimum quantity of shares you need to purchase depends on the stock. Here are a few terms to know before making your buy order:

Board Lot: The minimum purchase quantity

Fluctuation: The minimum change in price

Ultimately, the Board Lot is affected by the share price.

Tap to see some examples

||| --- | --- || **Example A** || **Stock Board Lot/ Min. No. of Shares to Buy** | 1,000 ||
Share Price | 4.19 || **Fluctuation** | 0.01 || **Sample Acceptable Quantity of Shares you can buy** | 2,000
3,000
4,000
etc || **Example B** || **Stock Board Lot/Min. No. of Shares to Buy** | 100 || **Share Price** | 9.8 || **Fluctuation** | 0.01 || **Sample Acceptable Quantity of Shares you can buy** | 2,100
2,200
2,300
etc |

Tap to see the corresponding Board Lots and Fluctuations

||||||| --- | --- | --- | --- || **Board Lots and Price Fluctuations** || Price Range |
 Fluctuation | Board Lot | 0.0001 | to | 0.0099 | 0.0001 | 1,000,000 | 0.010 | to | 0.049 |
 0.001 | 100,000 | 0.050 | to | 0.2409 | 0.001 | 10,000 | 0.250 | to | 0.495 | 0.005 | 10,000 |
 10.50 | to | 4.99 | 0.01 | 1,000 | 5.00 | to | 9.99 | 0.01 | 100 | 10.00 | to | 19.98 | 0.02 | 100 |

GCash processes Buy and Sell orders from **12:00 AM to 11:59 PM on the same day**. This means that the processing of your Buy or Sell order begins on the **next business day** after you place the order.

Note:

If you place a Sell order and your balance is below the minimum required amount, the transaction will be rejected.

If you want to sell your full investment and not maintain the investment balance, **enter the total amount** of your investment when placing your Sell order.

Please refer to the table below for the processing days of each fund:

Buy Orders Sell Orders	Fund Order Completion Date
Allocation Date (Order Confirmation)	Crediting Date (Order Completion)
Philippine Stock Index Fund	3 Business Days 3 Business Days 6 Business Days ATRAM Peso Money Market Fund

If you are upgrading from a GSav account to CIMB Grow, your new higher interest rate will start on the next cycle (which begins on the first of every month).

Example Scenario:

Opt-in Date: September 15, 2024

Interest Rate Before Next Cycle: 2.6% p.a. (September 16-30)

Next Monthly Cycle Start Date: October 1, 2024

New Interest Rate: 4.0% p.a. (effective October 1 onwards)

If you **do not have an existing GSave account** and you open CIMB Grow directly, you will immediately enjoy the 4.0% p.a. interest rate upon activation.

GLoan partners with 3rd party Financial Institutions.

If you're wondering how it can impact your loan experience, read on for important details:

Account Transfer

Qualified loan accounts may be moved to these partner institutions, as stated in [GLoan Terms & Conditions](#).

Loan Terms

Your loan terms will not change, whether with Fuse Financing Inc. or another partner. This means your payment schedule, dues, penalties, interest rates, and fees will stay the same. You may also continue making payments through GCash.

To find out if your loan is with **Fuse Financing Inc.** or a partner financial institution, view your **GLoan Disclosure Statement**.

You may not be eligible for GLoan due to the following:

- You are not 21-65 years old
- You are not a Filipino citizen
- Your GCash account is **not** Fully Verified
- You do not use GCash services on a regular basis

If you meet the requirements based on age, nationality, and frequency of usage but your account is not **Fully Verified** yet, here's what you can do:

1. On your GCash app, tap **Account**
2. Read the requirements and select the government ID you wish to upload
3. Scan your ID and take a selfie scan
4. Review your information > **Submit**

Read more on [how to get Fully Verified here.](#)

If GCash asked you to update your account, it's because it's been a while since you first verified it. The Bangko Sentral ng Pilipinas requires Fully Verified users to update their information regularly to keep full access to all GCash features.

Update your account before the deadline to avoid getting downgraded to a [Basic GCash account](#).

Tap to learn how to update your GCash account information

1. Open the GCash app, tap **Profile**, then tap your name
2. Tap **Update Account Information > Update your Profile**
3. Enter the 6-digit code sent to your GCash number, then tap Next
4. Fill in the needed information and complete the verification
5. Submit your update

You'll get an SMS when your profile is updated. Getting an update on your verification status may take up to **3 days**.

To keep your account secure and prevent unauthorized transactions, **GCash requires a Selfie Scan during your first login** after creating a new account. Here's how to take your selfie:

Before you begin, **make sure your front camera is working properly**.

1. Open your GCash app and tap **MPIN login**
2. Input your MPIN
3. Read the tips on how to take the perfect Selfie Scan and tap **Okay**
4. Take your selfie scan

After a successful selfie scan, you'll be directed to the GCash app homepage.

If your bank account unlinks from GCash despite previously linking it, there are several reasons why this might happen:

- 1. Account Security and Verification Issues** For security purposes, GCash may unlink accounts if there are inconsistencies in your account information. Make sure the details in your GCash and bank accounts match exactly to avoid verification problems.
- 2. System Maintenance or Updates**

GCash or the bank might undergo updates or maintenance, which could temporarily affect linked accounts. After such updates, accounts might require linking to restore functionality.

3. Inactivity or Expired Links

Some bank-to-GCash connections may unlink after prolonged inactivity or due to security protocols that invalidate old links.

4. Banks Policies or Limits

Your bank might have policies that require periodic re-verification of linked accounts. Additionally, exceeding cash-in limits or frequently failed transactions may trigger unlinking.

How to fix the issue:

Reverify and Re-link

1. Open your GCash app, go to **Cash In > Local Banks**
2. Tap the bank you want to link your bank account to under ‘Recommended Banks’
3. Follow the instructions to re-link your bank account. Ensure all account details are accurate.

If you are having issues in re-linking your bank account, [click here to ask for help](#). A customer service representative will contact you in **1-2 business days**.

Your next loan amount or credit limit on GLoan might be lower or smaller because of the following:

- **Loan Limits:** Your loan amount depends on your credit limit, which changes based on your GCash usage and repayment history.
- **GCash Usage:** Using GCash services like paying bills or sending money
- **Repayment History:** Paying loans on time or before your due date

Note: GLoan is a pre-qualified loan offered to select users. GLoan offers and approvals are subject to evaluation and are not guaranteed

To increase your GLoan amount, regularly use services like Cash In, Pay QR, Pay Bills, GSave, and GInvest. Also, make sure to pay your existing GLoan dues on time.

If you received an email on Account Deactivation and cannot access your GCash account anymore, it means your GCash Basic account was deactivated/closed.

A GCash account **will be deactivated if it is not fully verified within 12 months** from the time the account was opened. This is in line with Bangko Sentral ng Pilipinas (BSP) rules and regulations . You may [click here](#) to read more about this policy.

If you want to use GCash again, you can [create a new GCash account](#).

If your account has money:

GCash Basic accounts that are unverified and have funds will be suspended and will be collected an **Account Maintenance Fee of PHP 15 monthly**. This fee will continue to be charged until the wallet balance reaches 0.

If you want to withdraw the remaining funds on your GCash Basic account, you may follow these [steps](#).

Your GCredit account was closed or revoked due to the following:

- **Outstanding GCredit dues of 3 months** - It has been 3 months since your due date and you have not settled your GCredit dues
- **Foreign nationality** - GCredit is only available to Filipino citizens and you are a foreign national
- **Maximum age requirement** - You are past 65 years old

If your GCredit account is permanently closed, you won't be able to use it for future transactions.

However, you can still pay off any remaining balance. GCash will send you an SMS if your GCredit account is closed.

(Optional) Add mini program members {#optional-add-mini-program-members}

Last updated: 2022-07-07

Path: miniprogram_gcash

(Optional) Add mini program members

2022-07-07 17:08

This topic describes the steps of the task to add members to a mini program. After creating the mini program, developer admins invite related developers to become members and add them to the mini program.

Procedures

To add members to a mini program, you can follow the corresponding steps as below:

Step 1: Navigate to Members tab

Click **Mini Program** on the navigation panel to the left to check the mini program list.

Click the name of the newly created mini program and then navigate to **Members** tab.

Step 2: Add members

Click **+ New member**, you can see all workspace members on the new member list. Select the workspace member you want and add the member to the mini program and click **Save**.

The workspace member will join to manage the mini program as a developer automatically.

Note: The workspace member who creates the mini program will be set as an admin of the mini program automatically.

You can change roles for the workspace member by clicking **Set As** and choose the mini program member role you want to assign to the workspace member. If you do not want the workspace member to manage the mini program, click **Delete** to remove the member from this mini program.

Now you have completed adding members for a mini program.

Next steps

[Upload mini programs](#)

[Generate QR codes](#)

[Remove mini programs](#)

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/platform/add_member

(Optional) Configure mini programs {#optional-configure-mini-programs}

Last updated: 2022-07-07

Path: miniprogram_gcash

(Optional) Configure mini programs

2022-07-07 17:08

This topic describes the steps of the task to configure a mini program. After uploading the mini program to the platform, developer admins can configure the mini program, such as editing client ID and merchant ID, adding features, and so on.

Procedures

To configure a mini program, you can follow the corresponding steps as below:

Step 1: Navigate to Versions tab

Click **Mini Program** on the menu panel to the left and then click the name of the newly created mini program to enter **Versions** tab.

Step 2: Set configurations

There are two scenarios to set configurations depending on whether you upload a version for the mini program:

- Mini programs without versions
- Mini programs with versions

Mini programs without versions

If you do not upload a version, you can click **Configuration** to set global configurations, which means the configurations you set will be effective to all versions you upload for the mini program.

Enter the following parameters for the global configurations:

Note: If the wallet supports multiple environments, you can set the client ID and merchant ID for multiple environments. If not, you can only set the client ID and merchant ID of the supported environment.

- **Client ID** is assigned to a merchant by the wallet in a specific scenario, for example, payment. A single merchant ID can have multiple client IDs based on different scenarios.
- **Merchant ID** is assigned to a merchant by the wallet. A single merchant can have multiple merchant IDs based on different wallets.
- **Whitelist:**
 - **Server Domain** in the whitelist can access data and make out-of-domain calls.
 - **H5 Domain** in the whitelist can access the mobile page (H5) via the web-view component.
 - **Tester Emails** in the whitelist can test the mini program during the release process.

After confirming the above parameters, click **Save** to save the current global configurations. Once versions are released, the global configuration will be active.

Mini programs with versions

If you already upload one or more versions, you can set global configurations for all versions or configurations for a single version.

Global configurations

To set global configurations, click **Configuration** in the upper left corner of the page.

Enter the same parameters as above.

Single version configurations

To set configurations for a single version, click **Config** under **Action**.

Enter the same parameters for a single version as the global configurations. If you both set global configurations and single version configurations, single version configurations have a higher priority to be active after release.

Note: In the single version configurations scenario, the environment you release the version is the same as the environment that you can configure the merchant ID and client ID.

In addition, you can also set or modify configurations for a single version during its release process by clicking **View Configuration**.

Now you have completed configuring mini programs.

Next steps

/v1/authorizations/applyToken {#/v1/authorizations/applytoken}

Last updated: 2023-01-29

Path: miniprogram_gcash

/v1/authorizations/applyToken

2023-01-29 20:55

POST /v1/authorizations/applyToken

The applyToken interface is used to obtain the access token. This interface can be used in the following cases:

- After the merchant receives **authCode** from Mini-Program, the merchant uses this interface to request the access token from e-wallet. In this scenario, the interface generally needs to be used with the Authorization Prepare Interface.
- When the original token expires, the merchant requests a new access token by using the refresh token. In this scenario, this interface can be used independently.

Message structure

Request

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||

referenceClientId | String | No | In Mini-Program scenario, it is the unique identifier of the Mini-Program authorized by the user.

The referenceClientId represents the next-level client id. When multiple auth codes need to be assigned to the same client, different referenceClientIds can be passed in to distinguish them.

Max. length: 128 characters. || **grantType** | String | Yes | Indicates which parameter is to be used to obtain the access token. Possible values are:

- **AUTHORIZATION_CODE**: the authCode is to be used to retrieve the accessToken.

- **REFRESH_TOKEN**: the refreshToken is to be used to retrieve the accessToken.

Max. length: 16 characters. || **authCode** | String | No | Is required when **grantType** is **AUTHORIZATION_CODE**.

The authorization code, which is used by confidential and public clients to exchange an authorization code for an access token. After the user returns to the client via the Mini-program API, the Mini-program will get the authorization code from the response of and use it to request an access token.

Max. length: 32 characters. || **refreshToken** | String | No |

refreshToken is required when **grantType** is **REFRESH_TOKEN**.

The refresh token, which is used by the auth client to exchange for a new access token when the access token expires. By using the refresh token, new access tokens can be obtained without further interaction with the user.

Max. length: 128 characters. || **extendInfo** | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

Response

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || **result** | **Result**

| Yes | The request result, which contains information related to the request result, such as status and error codes. || **accessToken** | String | No | An access token that can be used to access the user resource scope.

When authorization application is successful [**result.resultStatus == S**], the auth client might use accessToken to access the corresponding user's resource scope.

Max. length: 128 characters. || **accessTokenExpiryTime** | String/Datetime | No | Access token expiration time, which follows the [ISO 8601](#) standard. After this time, authClient will not be able to use this token to deduct from user's account.

This parameter must be returned when authorization application is successful [**result.resultStatus == S**], and the accessToken will be invalid after **accessTokenExpiryTime**. || refreshToken | String | No | The refresh token that is used by the auth client to exchange for a new access token when the access token expires. By using the refresh token, new access tokens can be obtained without further interaction with the user.

This parameter must be returned when authorization application is successful [**result.resultStatus == S**], and the merchant can use the **refreshToken** to request for a new **accessToken**.

Max. length: 128 characters. || refreshTokenExpiryTime | String/Datetime | No | Refresh token expiration time, after which the auth client cannot use this token to retrieve a new access token. The value follows the [ISO 8601](#) standard.

This parameter must be returned when authorization application is successful [**result.resultStatus == S**], and the merchant will not be able to use the refreshToken to retrieve a new **accessToken** after **refreshTokenExpiryTime**. || customerId | String | No | Resource owner id, maybe user id, app id of merchant's application, merchant id.

Max. length: 64 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

Result process logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, the authorization token application request is successful. The merchant can use the access token to access the corresponding user resource scope.
- If the value of **result.resultStatus** is **F** or **U**, AuthClient may guide user to try again.

Result

```
||||| --- | --- | --- || resultStatus | resultCode | resultMessage || S | SUCCESS | Success.
|| U | UNKNOWN_EXCEPTION | An API calling is failed, which is caused by unknown reasons. || U | REQUEST_TRAFFIC_EXCEED_LIMIT | The request traffic exceeds the limit. || F | PROCESS_FAIL | A general business failure occurred. Don't retry. || F |
PARAM_ILLEGAL | Illegal parameters exist. For example, a non-numeric input, or an invalid date. || F | ACCESS_DENIED | The access is denied. || F | INVALID_API | The called API is invalid or not active. || F |
AUTH_CLIENT_UNSUPPORTED_GRANT_TYPE | The auth client do not support this grant type. || F | INVALID_AUTH_CLIENT | The auth client is invalid. || F |
INVALID_AUTH_CLIENT_STATUS | Invalid auth client status. || F |
INVALID_REFRESH_TOKEN | The refresh token is invalid. || F |
EXPIRED_REFRESH_TOKEN | The refresh token is expired. || F |
USED_REFRESH_TOKEN | The refresh token has been used. || F | INVALID_CODE | The authorization code is invalid. || F | USED_CODE | The authorization code has been used. || F | EXPIRED_CODE | The authorization code is expired. || F |
REFERENCE_CLIENT_ID_NOT_MATCH | The reference client id does not match. || F |
EXPIRED_AGENT_TOKEN | The access token of mini program is expired. || F |
INVALID_AGENT_TOKEN | The access token of mini program is invalid. |
```

Sample

The authorization token application is used to exchange the access token based on the auth code after obtaining the auth code.

1. The Mini Program calls my.getAuthCode interface to obtain the authorization code from e-wallet. (Step 1)
2. E-wallet returns the authorization code to the Mini Program (Step 7)
3. The Mini Program sends authorization code to the merchant server (Step 8)
4. The merchant server calls /v1/authorizations/applyTokeninterface to obtain the access token from e-wallet server and e-wallet server returns the access token and customer ID to the merchant server (Step 9 and Step 11).

Note: Other steps are covered by e-wallet.

Request

A. Retrieving accessToken with authCode

copy

```
{
  "referenceClientId": "305XST2CSG0N4P0xxxx",
  "grantType": "AUTHORIZATION_CODE",
  "authCode": "2810111301lGZcM9Cj1F91WH00039190xxxx",
  "extendInfo": "{\"customerBelongsTo\":{\"siteNameExample\"}}"
}
```

B. Retrieving accessToken with refreshToken

copy

```
{
  "grantType": "REFRESH_TOKEN",
  "refreshToken": "2810111301lGZcM9Cj1F91WH00039190xxxx",
  "extendInfo": "{\"customerBelongsTo\":{\"siteNameExample\"}}"
}
```

- **authCode** is from the my.getAuthCode JS-API, you can obtain the authCode in the success callback. when **grantType == AUTHORIZATION_CODE** means that we are requesting for the accessToken by the authCode .
- **refreshToken** is obtained from the response of the previous accessToken Application call. while **grantType == REFRESH_TOKEN** means that we are requesting for the accessToken by providing the refreshToken.
- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "accessToken": "281010033AB2F588D14B43238637264FCA5AAF35xxxx",
  "accessTokenExpiryTime": "2019-06-06T12:12:12+08:00",
  "refreshToken": "2810100334F62CBC577F468AAC87CFC6C9107811xxxx",
  "refreshTokenExpiryTime": "2019-06-08T12:12:12+08:00",
  "customerId": "1000001119398804xxxx"
}
```

- **result.resultStatus==S** shows that the application is successful,
- AuthClient can make use of **accessToken** to access the user's resource scope before 2019-06-06T12:12:12+08:00 [**accessTokenExpiryTime**].
- AuthClient can make use of **refreshToken** to request for a new accessToken before 2019-06-08T12:12:12+08:00 [**refreshTokenExpiryTime**].

/v1/authorizations/applyToken

2021-05-09 18:43

POST /v1/authorizations/applyToken

The applyToken interface is used to obtain the access token. This interface can be used in the following cases:

- After the merchant receives **authCode** from Mini-Program, the merchant uses this interface to request the access token from e-wallet. In this scenario, the interface generally needs to be used with the Authorization Prepare Interface.
- When the original token expires, the merchant requests a new access token by using the refresh token. In this scenario, this interface can be used independently.

Message structure

Request

		Property	Data type	Required	Description
referenceClientId	String No	In Mini-Program scenario, it is the unique identifier of the Mini-Program authorized by the user.			
The referenceClientId represents the next-level client id. When multiple auth codes need to be assigned to the same client, different referenceClientIds can be passed in to distinguish them.					
Max. length: 128 characters.	grantType String Yes	Indicates which parameter is to be used to obtain the access token. Possible values are:			
- AUTHORIZATION_CODE : the authCode is to be used to retrieve the accessToken.					
- REFRESH_TOKEN : the refreshToken is to be used to retrieve the accessToken.					
Max. length: 16 characters.	authCode String No	Is required when grantType is AUTHORIZATION_CODE .			
The authorization code, which is used by confidential and public clients to exchange an authorization code for an access token. After the user returns to the client via the Mini-program API, the Mini-program will get the authorization code from the response of and use it to request an access token.					
Max. length: 32 characters.	refreshToken String No	refreshToken is required when grantType is REFRESH_TOKEN .			
The refresh token, which is used by the auth client to exchange for a new access token when the access token expires. By using the refresh token, new access tokens can be obtained without further interaction with the user.					
Max. length: 128 characters.	extendInfo String No	The extend information, wallet and merchant can put extend info here.			
Max. length: 4096 characters.					

Response

		Property	Data type	Required	Description	result Result
Yes	The request result, which contains information related to the request result, such as status and error codes.	accessToken String No	An access token that can be used to access the user resource scope.			
When authorization application is successful [result.resultStatus == S], the auth client might use accessToken to access the corresponding user's resource scope.						
Max. length: 128 characters.	accessTokenExpiryTime String/Datetime No	Access token expiration time, which follows the <u>ISO 8601</u> standard. After this time, authClient will not be able to use this token to deduct from user's account.				
This parameter must be returned when authorization application is successful [result.resultStatus == S], and the accessToken will be invalid after accessTokenExpiryTime .	refreshToken String No	The refresh token that is used by the auth client to exchange for a new access token when the access token expires. By using the refresh token, new access tokens can be obtained without further interaction with the user.				
This parameter must be returned when authorization application is successful [result.resultStatus == S], and the merchant can use the refreshToken to request for a new accessToken .						
Max. length: 128 characters.	refreshTokenExpiryTime String/Datetime No	Refresh				

token expiration time, after which the auth client cannot use this token to retrieve a new access token. The value follows the [ISO 8601](#) standard.

This parameter must be returned when authorization application is successful

[result.resultStatus == S], and the merchant will not be able to use the refreshToken to retrieve a new **accessToken** after **refreshTokenExpiryTime**. || customerId | String | No | Resource owner id, maybe user id, app id of merchant's application, merchant id.

Max. length: 64 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

Result process logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, the authorization token application request is successful. The merchant can use the access token to access the corresponding user resource scope.
- If the value of **result.resultStatus** is **F** or **U**, AuthClient may guide user to try again.

Result

||||| --- | --- | --- || **resultStatus** | **resultCode** | **resultMessage** || S | SUCCESS | Success.
 || U | UNKNOWN_EXCEPTION | An API calling is failed, which is caused by unknown reasons. || U | REQUEST_TRAFFIC_EXCEED_LIMIT | The request traffic exceeds the limit. || F | PROCESS_FAIL | A general business failure occurred. Don't retry. || F |
 PARAM_ILLEGAL | Illegal parameters exist. For example, a non-numeric input, or an invalid date. || F | ACCESS_DENIED | The access is denied. || F | INVALID_API | The called API is invalid or not active. || F |
 AUTH_CLIENT_UNSUPPORTED_GRANT_TYPE | The auth client do not support this grant type. || F | INVALID_AUTH_CLIENT | The auth client is invalid. || F |
 INVALID_AUTH_CLIENT_STATUS | Invalid auth client status. || F |
 INVALID_REFRESH_TOKEN | The refresh token is invalid. || F |
 EXPIRED_REFRESH_TOKEN | The refresh token is expired. || F |
 USED_REFRESH_TOKEN | The refresh token has been used. || F | INVALID_CODE | The authorization code is invalid. || F | USED_CODE | The authorization code has been used. || F | EXPIRED_CODE | The authorization code is expired. || F |
 REFERENCE_CLIENT_ID_NOT_MATCH | The reference client id does not match. || F |
 EXPIRED_AGENT_TOKEN | The access token of mini program is expired. || F |
 INVALID_AGENT_TOKEN | The access token of mini program is invalid. |

Sample

The authorization token application is used to exchange the access token based on the auth code after obtaining the auth code.

1. The Mini Program calls my.getAuthCode interface to obtain the authorization code from e-wallet. (Step 1)
2. E-wallet returns the authorization code to the Mini Program (Step 7)
3. The Mini Program sends authorization code to the merchant server (Step 8)

4. The merchant server calls /v1/authorizations/applyTokeninterface to obtain the access token from e-wallet server and e-wallet server returns the access token and customer ID to the merchant server (Step 9 and Step 11).

Note: Other steps are covered by e-wallet.

Request

A. Retrieving accessToken with authCode

copy

```
{
  "referenceClientId": "305XST2CSG0N4P0xxxx",
  "grantType": "AUTHORIZATION_CODE",
  "authCode": "2810111301lGZcM9Cjlf91WH00039190xxxx",
  "extendInfo": "{\"customerBelongsTo\": \"siteNameExample\"}"
}
```

B. Retrieving accessToken with refreshToken

copy

```
{
  "grantType": "REFRESH_TOKEN",
  "refreshToken": "2810111301lGZcM9Cjlf91WH00039190xxxx",
  "extendInfo": "{\"customerBelongsTo\": \"siteNameExample\"}"
}
```

- **authCode** is from the my.getAuthCode JS-API, you can obtain the authCode in the success callback. when **grantType == AUTHORIZATION_CODE** means that we are requesting for the accessToken by the authCode .
- **refreshToken** is obtained from the response of the previous accessToken Application call. while **grantType == REFRESH_TOKEN** means that we are requesting for the accessToken by providing the refreshToken.
- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "accessToken": "281010033AB2F588D14B43238637264FCA5AAF35xxxx",
  "accessTokenExpiryTime": "2019-06-06T12:12:12+08:00",
```

```

    "refreshToken": "2810100334F62CBC577F468AAC87CFC6C9107811xxxx",
    "refreshTokenExpiryTime": "2019-06-08T12:12:12+08:00",
    "customerId": "1000001119398804xxxx"
}

```

- **result.resultStatus==S** shows that the application is successful,
- AuthClient can make use of **accessToken** to access the user's resource scope before 2019-06-06T12:12:12+08:00 [**accessTokenExpiryTime**].
- AuthClient can make use of **refreshToken** to request for a new accessToken before 2019-06-08T12:12:12+08:00 [**refreshTokenExpiryTime**].

/v1/authorizations/cancelToken

2022-07-04 03:44

POST /v1/authorizations/cancelToken

The cancelToken API is used to cancel access token at wallet.

Message structure

Request

Property	Data type	Required	Description
accessToken	String	Yes	An access token that can be used to access the user resource scope. Max. length: 128 characters.
extendInfo	String	No	The extend information,wallet and merchant can put extend info here. Max. length: 4096 characters.

Response

Property	Data type	Required	Description	Result
result	Object	Yes	The request result, which contains information related to the request result, such as status and error codes.	The extend information,wallet and
extendInfo	String	No		

merchant can put extend info here.
Max. length: 4096 characters. |

Result process logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, that means the authorization is cancelled successfully. AuthClient will not be able to use the AccessToken to access user's resources, and may not use the relative refreshToken to retrieve new AccessToken.
- If the value of **result.resultStatus** is **F** or **U**, that means authorization is cancelled failed, AuthClient may guide user to try again.

Result

```
||||| --- | --- | --- || resultStatus | resultCode | resultMessage || S | SUCCESS | Success.
|| U | UNKNOWN_EXCEPTION | An API calling is failed, which is caused by unknown
reasons. || U | REQUEST_TRAFFIC_EXCEED_LIMIT | The request traffic exceeds the
limit. || F | PROCESS_FAIL | A general business failure occurred. Don't retry. || F |
PARAM_ILLEGAL | Illegal parameters exist. For example, a non-numeric input, or an
invalid date. || F | ACCESS_DENIED | The access is denied. || F | INVALID_API | The
called API is invalid or not active. || F | INVALID_AUTH_CLIENT_STATUS | Invalid
auth client status. || F | INVALID_ACCESS_TOKEN | The access token is invalid. || F |
INVALID_AUTH_CLIENT | The auth client id is invalid. || F |
EXPIRED_ACCESS_TOKEN | The access token is expired. || F |
EXPIRED_AGENT_TOKEN | The access token of mini program is expired. || F |
INVALID_AGENT_TOKEN | The access token of mini program is invalid. |
```

Sample

You can cancel the authorization. After cancellation, the refresh_token cannot be used even if it is valid.

When user cancel access token from the Mini Program,

1. The Merchant server calls /v1/authorizations/cancelToken interface to cancel access token (Step 2).
2. And wallet server returns token cancel result to merchant server (Step 3).

Request

copy

```
{
  "accessToken": "281010033AB2F588D14B43238637264FCA5Axxxx",
  "extendInfo": "{\"customerBelongsTo\":\"siteNameExample\"}"
}
```

- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  }
}
```

/v1/payments/inquiryPayment {#/v1/payments/inquirypayment}

Last updated: 2022-07-03

Path: miniprogram_gcash

/v1/payments/inquiryPayment

2022-07-03 18:44

POST /v1/payments/inquiryPayment

The **inquiryPayment** API is used to inquire the payment result, usually when not able to receive the payment result after a long period of time. Such as:

Note:

1. After Merchant initiates payment and not able to receive the payment result after a long period of time, it can poll Payment Status Inquiry interface.
2. Merchant uses InquiryPayment to determine the Payment status in the asynchronous Payment processing scenario.

Round-robin interval, recommended 5s once, up to 1 minute.

Message structure

Request

Property	Data type	Required	Description
partnerId	String	Yes	The partnerId allocated by wallet. Max. length: 32 characters.
paymentId	String	No	The unique ID of a payment generated by Wallet.
paymentRequestId	String	No	The unique ID of a payment generated by Wallet merchants.
extendInfo	String	No	The extend information, wallet and merchant can put extend info here.
			Max. length: 4096 characters.

Response

Property	Data type	Required	Description	Result
result	String	Yes	The request result, which contains information related to the request result, such as status and error codes.	
paymentId	String	No	The unique ID of a payment generated by Wallet.	
paymentRequestId	String	No	The unique ID of a payment generated by Wallet merchants.	
paymentAmount	Amount	No	Order amount for display of user consumption records, payment results page.	
paymentTime	String/Datetime	No	Payment success time, which follows the <u>ISO 8601</u> standard.	
paymentStatus	String	No	SUCCESS - order is succeeded. FAIL - order is failed.	
PROCESSING			order is not paid or is paid but not finish.	
CANCELLED			order is cancelled.	
paymentFailReason	String	No	The fail reason of payment order when paymentStatus is FAIL.	
authExpiryTime	String/Datetime	No	Authorization expiry time, has value only when paymentFactor.isAuthorizationPayment is true.	
extendInfo	String	No	The extend information, wallet and merchant can put extend info here.	
			Max. length: 4096 characters.	

Result Process Logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, that means the payment status inquiry is successful, then check **paymentStatus**:
- if **paymentStatus** is **PROCESSING**, means order is not paid or is paid but not finish;

- if **paymentStatus** is **SUCCESS**, means order is succeeded;
- if **paymentStatus** is **FAIL**, means order is failed.
- if **paymentStatus** is **CANCELLED**, means order is cancelled.
- If the value of **result.resultStatus** is **F**, that means the payment status inquiry is fail. When **resultCode** is **ORDER_NOT_EXIST**, it means that the payment is not yet accepted and can be treated as payment failure. For the other failure reason, human intervention is recommended.
- If the value of **result.resultStatus** is **U**, that means unknown exception occur on wallet side, merchant may try again.

Result

```
|||||---|---|---|---|| No | resultStatus | resultCode | resultMessage || 1 | S |
SUCCESS | Success. || 2 | U | UNKNOWN_EXCEPTION | An API calling is failed,
which is caused by unknown reasons. || 3 | U | REQUEST_TRAFFIC_EXCEED_LIMIT
| The request traffic exceeds the limit. || 4 | F | ORDER_NOT_EXIST | The order doesn't
exist. || 5 | F | INVALID_API | The called API is invalid or not active. || 6 | F |
PARAM_ILLEGAL | Illegal parameters. For example, non-numeric input, invalid date. || 7 | F |
PROCESS_FAIL | A general business failure occurred. Don't retry. || 8 | F |
ACCESS_DENIED | The access is denied. || 9 | F | EXPIRED_AGENT_TOKEN | The
access token of mini program is expired. || 10 | F | INVALID_AGENT_TOKEN | The
access token of mini program is invalid. |
```

Sample

Example: A Russian user (Bob) bought a 100 USD product on the e-commerce platform, paid by credit card and submitted the payment synchronously, asynchronous polling payment results.

1. The Mini Program calls my.tradePay interface to do payment (Step 1).
2. E-wallet App returns payment result to the Mini Program (Step 5).
3. Also e-wallet notifies the payment result with paymentNotifyUrl provided by merchant (Step 4).
4. Besides the merchant could call /v1/payments/inquiryPayment interface to query the payment result (Step 6).
5. E-wallet will return payment status inquiry result to the merchant server (step 7).

Request

A. Inquiry By **paymentRequestId**

copy

```
{
  "paymentRequestId": "1022172000000000001xxxx",
  "partnerId": "20200101234567890132xxxx",
```

```
"extendInfo": "{\"customerBelongsTo\": \"siteNameExample\"}"
}
```

B. Inquiry By paymentId

copy

```
{
  "paymentId": "1022172000000000001xxxx",
  "partnerId": "20200101234567890132xxxx",
  "extendInfo": "{\"customerBelongsTo\": \"siteNameExample\"}"
}
```

- **paymentId** the unique Id of a payment generated by Wallet.
- **paymentRequestId** the unique Id of a payment generated by Wallet merchants.
- **partnerId** the partnerId allocated by Wallet.
- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Note:

This interface support querying with **paymentId** or **paymentRequestId**. **paymentId** has a higher priority than **paymentRequestId**, which means that if you offer both **paymentId** and **paymentRequestId**, we will use **paymentId** and ignore **paymentRequestId**.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "paymentId": "20200101234567890133333xxxx",
  "paymentRequestId": "20200101234567890133333xxxx",
  "paymentTime": "2020-01-01T12:01:01+08:30",
  "paymentAmount": {
    "value": "100",
    "currency": "USD"
  },
  "paymentStatus": "SUCCESS"
}
```

- **result . resultStatus==S** shows that the inquiry is successful.
- **paymentId** the unique Id of a payment generated by Wallet.
- **paymentRequestId** the unique Id of a payment generated by Wallet merchants.

- **paymentTime** describes the date time of the successful Wallet payment.
- **paymentAmount** describes the payment amount.
- **paymentStatus** describes the payment status.
- **paymentStatus.PROCESSING** order is not paid or is paid but not finish.
- **paymentStatus.SUCCESS** order is succeeded.
- **paymentStatus.FAIL** order is failed.
- **paymentStatus.CANCELLED** order is cancelled.
- **paymentFailReason** describes the payment fail reason when **paymentStatus=FAIL**.
- **authExpiryTime** describes the payment authorization expiry time, when payment order is **paymentFactor.isAuthorizationPayment=true**.

 Max. length: 64 characters. || refundRequestId | String | No | The unique ID of a refund generated by Merchant.
 Max. length: 64 characters. || refundAmount | **Amount** | No | Refund amount for display of user consumption records page. || refundReason | String | No | Refund reason.
 Max. length: 256 characters. || refundTime | String/Datetime | No | Deduct money from merchant success time, after then will start to refund money to user. which follows the ISO 8601 standard. || refundStatus | String | No | PROCESSING - refund is processing.
 SUCCESS - refund success.
 FAIL - refund failed. || refundFailReason | String | No | The fail reason of refund order when refundStatus is FAIL.
 Max. length: 256 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.
 Max. length: 4096 characters. |

Result Process Logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, the refund inquiry is successful. And you have to check **refundStatus**:
 - if **refundStatus** is **PROCESSING**, means refund is processing;
 - if **refundStatus** is **SUCCESS**, means refund success;
 - if **refundStatus** is **FAIL**, means refund failed.
- If the value of **result.resultStatus** is **F**, the refund inquiry is fail. When **resultCode** is **REFUND_NOT_EXIST**, it means that the refund is not yet accepted and can be treated as refund failure. For the other failure reason, human intervention is recommended.

- If the value of **result.resultStatus** is **U**, the refund inquiry is unknown exceptionprocessing failure occurs, probably due to system / network issues, merchant can retry.

Result

```
|||||---|---|---|---|| No | resultStatus | resultCode | resultMessage || 1 | S |
SUCCESS | Success. || 2 | U | UNKNOWN_EXCEPTION | An API calling is failed,
which is caused by unknown reasons. || 3 | U | REQUEST_TRAFFIC_EXCEED_LIMIT
| The request traffic exceeds the limit. || 4 | F | REFUND_NOT_EXIST | Refund is not
exist. || 5 | F | INVALID_API | The called API is invalid or not active. || 6 | F |
PARAM_ILLEGAL | Illegal parameters. For example, non-numeric input, invalid date. || 7 | F |
PROCESS_FAIL | A general business failure occurred. Don't retry. || 8 | F |
ACCESS_DENIED | The access is denied. || 9 | F | EXPIRED_AGENT_TOKEN | The
access token of mini program is expired. || 10 | F | INVALID_AGENT_TOKEN | The
access token of mini program is invalid. |
```

Sample

For example, a Korean user purchases a 100 USD merchandise at a Japanese merchant with cross-border payment.

Merchant refund the money, but not return the refund result. so merchant begin to inquiry refund result.

1. User could start refund request from the Mini Program or the merchant cashier (Step 1).
2. The merchant server calls /v1/payments/refund interface to refund (Step 2).
3. E-wallet returns the refund result to the merchant server (Step 3).
4. Also the merchant server could call /v1/payments/inquiryRefund interface to query the refund result (Step 4).
5. E-wallet returns refund inquiry result to the merchant server (Step 5).
6. The merchant should return the refund result to the Mini Program or the merchant cashier (Step 6).

Request

copy

```
{
  "refundId": "1022188000000000001xxxx",
  "refundRequestId": "20200101234567890132xxxx",
  "partnerId": "10221720000000000001xxxx",
  "extendInfo": "{\"customerBelongsTo\": \"siteNameExample\"}"
}
```

- **refundId** refundId return by wallet.
- **refundRequestId** the uniqueId of a refund generated by Merchant.
- **partnerId** the partnerId allocated by wallet.

- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo'.

Note:

This interface support querying with **refundId** or **refundRequestId**. **paymentId** has a higher priority than **refundRequestId**, which means that if you offer both **refundId** and **refundRequestId**, we will use **refundId** and ignore **refundRequestId**.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "refundId": "20200101234567890144444xxxx",
  "refundRequestId": "20200101234567890155555xxxx",
  "refundAmount": {
    "value": "100",
    "currency": "USD"
  },
  "refundReason": "refund reason.",
  "refundTime": "2020-01-02T12:01:01+08:30",
  "refundStatus": "SUCCESS",
  "refundFailReason": "the fail reason of refund order when refundStatus is FAIL.",
  "extendInfo": ""
}
```

- **result**.resultStatus==S****shows that the refund is successful.
- **refundId**refundId return by wallet.
- **refundRequestId**merchant refund request id.
- **refundAmount**refund amount by merchant.
- **refundReason**describes the refund reason.
- **refundTime**refund process finish time, that means deduct from merchant success.
- **refundStatus**refund Status.
- ****refundStatus.PROCESSING:****refund is processing.
- ****refundStatus.SUCCESS:****refund success.
- ****refundStatus.FAIL:****refund failed.
- **refundFailReason**the fail reason of refund order when refundStatus is Fail.

/v1/payments/notifyPayment {#/v1/payments/notifypayment}

Last updated: 2022-07-03

Path: miniprogram_gcash

/v1/payments/notifyPayment

2022-07-03 18:44

POST /v1/payments/notifyPayment

The notifyPayment API is used to notify payment result to merchant/partner.

Note:

1. to notify merchant/partner the payment result when payment processing reaches the final state (Success/Fail).
2. Not all scenario merchant/partner need receive this notify. Such as sync payment scenario(B Scan C, Agreement Pay).

Message structure

Request

Property	Data type	Required	Description
partnerId	String	Yes	The partnerId allocated by wallet. Max. length: 32 characters.
paymentId	String	Yes	The unique ID of a payment generated by Wallet.
paymentRequestId	String	Yes	The unique ID of a payment generated by Wallet merchants.
paymentAmount	Amount	Yes	Order amount for display of user consumption records, payment results page.
paymentTime	String/Datetime	No	Payment success time, which follows the <u>ISO 8601</u> standard.
paymentStatus	String	Yes	SUCCESS - order is succeeded. FAIL - order is failed.
paymentFailReason	String	No	The fail reason of payment order when paymentStatus is FAIL.
extendInfo	String	No	The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters.

Response

		Property	Data type	Required	Description	result	Result
	Yes	The request result, which contains information related to the request result, such as status and error codes.					

Result Process Logic

- If result.resultStatus == S, Means the merchant/partner already received this notification.
- If result.resultStatus == F, it means merchant/partner handle this notification failed.
- If result.resultStatus==U, it means merchant/partner handle this notification occur unknown exception, wallet will retry if get U response.
- If other response (almost never occur),wallet will process like U.

Result

--- --- --- ---	No	resultStatus	resultCode	resultMessage	1 S	
SUCCESS Success.	2 U UNKNOWN_EXCEPTION An API calling is failed, which is caused by unknown reasons.	3 U REQUEST_TRAFFIC_EXCEED_LIMIT The request traffic exceeds the limit.	4 F REPEAT_REQ_INCONSISTENT Repeated submit, and requests are inconsistent.	5 F PROCESS_FAIL A general business failure occurred. Don't retry.	6 F INVALID_API The called API is invalid or not active.	7 F PARAM_ILLEGAL Illegal parameters. For example, non-numeric input, invalid date.

Sample

1. The Mini Program calls my.tradePay interface to do payment (Step 1).
2. E-wallet App returns payment result to the Mini Program (Step 5).
3. E-wallet notifies the payment result with paymentNotifyUrl provided by merchant (Step 4).

For example, a wallet user purchases a 100 USD merchandise at a merchant/partner, after user finished payment in wallet cashier page, wallet will send payment status notification to merchant/partner.

Payment

A. Request sample with payment success

copy

```
{
  "partnerId": "P00000000000001xxxx",
  "paymentId": "20191127190741010007000009999xxxx",
  "paymentRequestId": "201911271907410100070000088881xxxx",
  "paymentAmount": {
```

```

    "currency": "USD",
    "value": "10000"
},
"paymentTime": "2019-11-27T12:02:01+08:30",
"paymentStatus": "SUCCESS"
}

```

- **partnerId** is the identifier of a merchant/partner, allocated by Wallet.
- **paymentId** is generated by Wallet, uniquely identifies the payment.
- **paymentRequestId** is generated by merchant/partner, uniquely identifies this payment. In payment notify request, paymentRequestId should be the paymentRequestId in origin payment request.
- **paymentAmount** describes the amount of 100 USD already collected by Wallet from user account for this payment.
- **paymentTime** is the success date time of this transaction.
- **paymentStatus** is the payment status in wallet. SUCCESS means transaction already success.

B.

copy

```
{
  "partnerId": "P00000000000001xxxx",
  "paymentId": "20191127190741010007000009999xxxx",
  "paymentRequestId": "201911271907410100070000088881xxxx",
  "paymentAmount": {
    "currency": "USD",
    "value": "10000"
  },
  "paymentCreateTime": "2019-11-27T12:01:01+08:30",
  "paymentTime": "2019-11-27T12:02:01+08:30",
  "paymentStatus": "FAIL",
  "paymentFailReason": "Order payment expired."
}
```

- **paymentStatus** is the payment status in wallet. FAIL means this transaction already failed, usually payment fail are because of this payment already expired .
- **paymentFailReason** used to fill the payment fail reason, only payment status is FAIL will return this parameter.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  }
}
```

- **result.resultStatus==S** shows that merchant/partner already received this notification.

/v1/payments/pay

2022-07-03 18:44

POST /v1/payments/pay

The pay API is used to initiate a payment at wallet.

Note: A payment which takes place at *wallet*.

- 1) merchant/partner initiates payment request to *wallet* through Payment Interface.
- 2) Wallet will handle different payment scenarios base on the parameters in request.

Currently, payment API support following acquiring scenarios:

- Cashier Payment: Usually used in online payment scenario. In this scenario, merchant/partner will call this payment API to create order, and wallet will return cashier page url to merchant/partner, and then redirect to this cashier page. So user can finished payment in cashier page.

Message structure

Request

Property	Data type	Required	Description
partnerId	String	Yes	The partnerId allocated by wallet. Max. length: 32 characters.
appId	String	Yes	The mini program ID. Max. length: 32 characters.
productCode	String	No	Defined by wallet, wallet will use productCode to get the contract config which include fee,limit info. Max. length: 32 characters.
paymentOrderTitle	String	Yes	The order title of this payment. Max. length: 256 characters.
paymentRequestId	String	Yes	The unique ID of a payment generated by merchant. Max. length: 256 characters.

- Max. length: 64 characters.
- This field is used for the idempotence control. For the payment requests which are initiated with the same `paymentRequestId` and reach a final status (S or F), the wallet must return the unique result. || `paymentAmount` | Amount | Yes | Order amount for display of user consumption records, payment results page. || `paymentMethods` | PaymentMethod | No | The paymentMethod used to collect fund by wallet. || `paymentAuthCode` | String | No | If `payFactor.isAgreementPay` is true, then it's the `accessToken` of wallet user, if `payFactor.isPaymentCode` is true, then it's the authcode of wallet user.
Max. length: 128 characters. || `paymentFactor` | PaymentFactor | No | In the Mini Program scenario, it is fixed value, map format, `{"isCashierPayment": true}`. || `paymentExpiryTime` | String/Datetime | No | The payment order close time defined by merchant, which follows the ISO 8601 standard. || `paymentReturnUrl` | String | No | The redirect url defined by merchant.
- Max. length: 1024 characters. || `paymentNotifyUrl` | String | No | The payment success notify url defined by merchant.
- Max. length: 1024 characters. || `mcc` | String | No | The merchant category code.
- Max. length: 32 characters. || `extraParams` | Map | No | Map format, specific payment ability which provided by wallet, now we only support 1 key : ORDER. || `extendInfo` | String | No | The extend information, wallet and merchant can put extend info here.
- Max. length: 4096 characters. || `envInfo` | EnvInfo | No | Environment information of mobile phone. |

Response

- | | <u>Property</u> | <u>Data type</u> | <u>Required</u> | <u>Description</u> | <u>result</u> <u>Result</u> |
|-------------------------------|---|------------------|-----------------|--------------------|---|
| | | | | | Yes The request result, which contains information related to the request result, such as status and error codes. <code>paymentId</code> String No The unique ID of a payment generated by Wallet. |
| Max. length: 64 characters. | <code>paymentTime</code> String/Datetime No Payment success time, which follows the <u>ISO 8601</u> standard. <code>actionForm</code> <u>ActionForm</u> No <code>authExpiryTime</code> String/Datetime No Authorization expiry time, has value only when <code>paymentFactor.isAuthorizationPayment</code> is true. <code>extendInfo</code> String No The extend information, wallet and merchant can put extend info here. | | | | |
| Max. length: 4096 characters. | | | | | |

Result process logic

For different request results, different actions are to be performed. See the following list for details:

- **result.resultStatus = S**
 - That means this transaction is success, merchant/partner can update transaction to success. What need to notice is :
 - In payment evaluation scenario, 'S' just means evaluate success, no real fund transfer.
 - In authorization payment scenario, 'S' just means authorization success, need wait for capture operation to finish the transaction(finish final fund flow).
- **result.resultStatus = A**

- That means transaction already accept by wallet. Merchant/partner need continue the next step operation according to actionForm response. Such as display order code to user or redirect to wallet cashier page.
- **result.resultStatus = F**
 - That means this transaction is failed, the failed reason can refer to result code param. Usually F transactions can not be success again if use the same payment request to call wallet.
- **result.resultStatus = U**
 - That means unknown exception occur on wallet side. Merchant/partner can inquiry payment result or waiting for payment status notification to get the real payment result. What need to notice is :
 - Payment evaluation scenario can not inquiry.
 - U status can not set to fail or success on merchant/partner system.
 - U status can not refund to user by offline(Maybe will make fund loss).

Result

```
|||||---|---|---|| resultStatus | resultCode | resultMessage || S | SUCCESS | Success.
|| U | UNKNOWN_EXCEPTION | An API calling is failed, which is caused by unknown
reasons. || U | REQUEST_TRAFFIC_EXCEED_LIMIT | The request traffic exceeds the
limit. || U | PAYMENT_IN_PROCESS | The payment is still under process. || A |
ACCEPT | Need next action according to actionForm. || F |
REPEAT_REQ_INCONSISTENT | Repeated submit, and requests are inconsistent. || F |
PROCESS_FAIL | A general business failure occurred. Don't retry. || F | INVALID_API |
The called API is invalid or not active. || F | PARAM_ILLEGAL | Illegal parameters
exist. For example, a non-numeric input, or an invalid date. || F | ACCESS_DENIED |
The access is denied. || F | PAYMENT_AMOUNT_EXCEED_LIMIT | Payment amount
exceeds limit. || F | USER_NOT_EXIST | User not exist. || F |
USER_STATUS_ABNORMAL | The user status is abnormal. || F |
USER_BALANCE_NOT_ENOUGH | User balance is not enough for this payment. || F |
PARTNER_NOT_EXIST | Partner not exist. || F | PARTNER_STATUS_ABNORMAL |
Partner status abnormal. || F | RISK_REJECT | Risk reject. || F |
CURRENCY_NOT_SUPPORT | The currency is not supported. || F |
ORDER_STATUS_INVALID | Order is in invalid status such closed. || F |
INVALID_ACCESS_TOKEN | Invalid accesstoken. || F |
USER_AMOUNT_EXCEED_LIMIT | Payment amount exceeds user's amount limit. || F |
EXPIRED_ACCESS_TOKEN | The access token is expired. || F |
AUTH_CODE_ALREADY_USED | Auth code already used. || F | INVALID_CODE |
Auth code illegal. || F | EXPIRED_AGENT_TOKEN | The access token of mini program
is expired. || F | INVALID_AGENT_TOKEN | The access token of mini program is
invalid. |
```

Sample

Cashier Payment

For example, a user purchases a 100 USD merchandise at the merchant/partner(online merchant usually) , merchant/partner call this payment api to create payment order first, wallet will return payment order id and wallet cashier page url to merchant/partner, then merchant/partner can redirect user to wallet cashier page with my.tradePay api.

1. Firstly the Mini Program create order (Step 1).
 2. The merchant server calls /v1/payments/pay interface with paymentNotifyUrl to initiate payment flow (Step 2).
 3. E-wallet server returns payment detail information with paymentId to the merchant server (Step 3).
 4. The merchant server has to pass through the payment detail information to the Mini Program (step 4).
 5. And the Mini Program should call my.tradePay interface to do payment (Step 5).
 6. When the payment reaches the final status, e-wallet server notifies the payment result to the merchant server with paymentNotifyUrl provided in Step 2 (Step 8).
 7. Also E-wallet App returns payment result to the Mini Program (Step 9).

Request

copy

```
{  
    "partnerId": "P0000000000000001xxxx",  
    "paymentRequestId": "2019112719074101000700000077771xxxx",  
    "paymentOrderTitle": "SHOES",  
    "productCode": "PC_5800000001",  
    "mcc": "4399",  
    "paymentAmount": {  
        "currency": "USD",  
        "value": "10000"  
    },  
    "paymentFactor": {  
        "isCashierPayment": true  
    },  
    "paymentReturnUrl": "https://www.merchant.com/redirectxxx",  
    "paymentNotifyUrl": "https://www.merchant.com/paymentNotifyxxx",  
    "extraParams": {  
        "ORDER": "  
        {"referenceOrderId": "ID_000001", "orderAmount": "  
        {"currency": "USD", "value": "10000"}},  
        "extendInfo": {"customerBelongsTo": "siteNameExample"},  
        "envInfo": {  
            "osType": "IOS",  
            "terminalType": "APP"  
        }  
    }  
}
```

- **partnerId** is the identifier of a merchant/partner, allocated by Wallet.

- **paymentRequestId** is generated by merchant/partner, uniquely identifies the payment. Wallet must make use of paymentRequestId and partnerId for idempotent control. For example, if a payment with paymentRequestId==201911271907410100070000077771xxxx and partnerId==P0000000000000001xxxx has been processed successfully by Wallet, when merchant/partner uses the same paymentRequestId and partnerId for payment, Wallet will respond with successful payment.
- **productCode** defined by wallet, wallet will use productCode to get the contract config which include fee,limit info.
- **paymentFactor** In the Mini Program scenario, the **PaymentFactor** only have the fixed value: isCashierPayment = true
- **paymentReturnUrl** is the url defined by merchant/partner. In cashier payment scenario, after user finished payment in wallet cashier page, wallet will direct back to merchant base on this URL.
- **paymentNotifyUrl** is the url defined by merchant/partner. In cashier payment scenario, after user finished payment in wallet cashier page, wallet will notify merchant the payment result base on this URL.
- **paymentAmount** describes the amount of 100 USD to be collected by Wallet from user account for this payment.
- **extraParams**, only includes 1 key - **ORDER** now. ORDER describes the order details of the purchase of the 100 USD merchandise by the user at the merchant. Such as Merchant, Buyer, Goods, etc are included in order . The information in the Order is only used to display user's payment result page and transactions history, regulation reporting, etc. It will not make use of the amount in the order for fund operation.
- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Response

copy

```
{
  "result": {
    "resultCode": "ACCEPT",
    "resultStatus": "A",
    "resultMessage": "accept"
  },
  "paymentId": "string",
  "actionForm": {
    "actionFormType": "REDIRECTION",
    "redirectionUrl": "http://www.merchant.com/cashier?orderId=xxxxxxxx"
  }
}
```

- **result.resultStatus ==A** shows that the payment is accept success. After user finish payment in cashier page, payment will change to success.
- **paymentId** is generated by Wallet, uniquely identifies the payment.
- **actionForm** will return cashier page url to merchant/partner, after merchant/partner received accept result, will redirect to this URL.

/v1/payments/refund

2022-07-05 23:31

POST /v1/payments/refund

The refund API is used to initiate a refund of a successful payment, refund a transaction and return money back to payer, the transaction can be refunded partially or fully. The api will return SUCCESS when deduct money from merchant succes.

Note:

1. Merchant/partner submits refund request to wallet directly
2. Wallet will determine if the refund is successful based on its own payment status and respond to Merchant/partner.
3. Can support multiple refund for 1 success payment, but total refund amount can not greater than payment amount.

Message structure

Request

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || partnerId | String | Yes | The partnerId allocated by wallet.

Max. length: 32 characters. || refundRequestId | String | Yes | The unqiueId of a refund generated by Merchant.

- Max. length: 64 characters.

- This field is used for idempotence control. For the refund requests which are initiated with the same refundRequestId and reach a final status (S or F), the wallet must return the unique result. || paymentId | String | No | The payment Id for the corresponding original payment.

Max. length: 64 characters. || paymentRequestId | String | No | The paymentRequestId for the corresponding original payment.

Max. length: 64 characters. || refundAmount | Amount | Yes | Refund amount. || refundReason | String | No | Refund reason.

Max. length: 256 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

Response

Property	Data type	Required	Description	result	Result
Yes The request result, which contains information related to the request result, such as status and error codes.	refundId String No Unique refund order number. It is mandatory when the result.resultStatus is S.				

Max. length: 64 characters. || refundTime | String/Datetime | No | Deduct money from merchant success time, after then will start to refund money to user. which follows the [ISO 8601](#) standard. It is mandatory when the **result.resultStatus** is S. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

Result Process Logic

For different request results, different actions are to be performed. See the following list for details:

- If the value of **result.resultStatus** is **S**, the refund is successful, merchant/partner can process as success.
- If the value of **result.resultStatus** is **F**, the refund has failed, such as caused by refund date time exceeding the allowable refund window (**result . resultCode = REFUND_WINDOW_EXCEED**), such as refund amount greater than payment amount etc.
- If the value of **result.resultStatus** is **U**, means refund unknown exception, merchant/partner can calls Refund Inquiry Interface/retry Refund Interface to query to get refund result. What need to notice is as follow:
 - U status (inquiry/retry still get U) can not set to fail or success on merchant/partner system.
 - U status (inquiry/retry still get U) should not refund/charge to user by offline(Maybe will make fund loss).
 - If other response (almost never occur), merchant/partner should process like U.

Result

No	resultStatus	resultCode	resultMessage	1 S
1 SUCCESS Success.	2 U UNKNOWN_EXCEPTION An API calling is failed, which is caused by unknown reasons.	3 U REQUEST_TRAFFIC_EXCEEDED_LIMIT The request traffic exceeds the limit.	4 F REPEAT_REQ_INCONSISTENT Repeated submit, and requests are inconsistent.	5 F PROCESS_FAIL A general business failure occurred. Don't retry.
6 F PARAM_ILLEGAL Illegal parameters exist. For example, a non-numeric input, or an invalid date.	7 F INVALID_API The called API is invalid or not active.	8 F ACCESS_DENIED The access is denied.	9 F	10 F

PARTNER_STATUS_ABNORMAL | Partner status abnormal. || 11 | F |
 ORDER_NOT_EXIST | Order does not exist. || 12 | F | ORDER_STATUS_INVALID |
 Order status is invalid. || 13 | F | REFUND_WINDOW_EXCEED | Exceed Refund
 window. || 14 | F | REFUND_AMOUNT_EXCEED | The total refund amount has exceed
 the payment amount. || 15 | F | PARTNER_BALANCE_NOT_ENOUGH | The partner
 balance is not enough. || 16 | F | CURRENCY_NOT_SUPPORT | The currency is not
 supported. || 17 | F | EXPIRED_AGENT_TOKEN | The access token of mini program is
 expired. || 18 | F | INVALID_AGENT_TOKEN | The access token of mini program is
 invalid. |

Sample

For example, a wallet user applies for refund of 100 USD of a successful payment at merchant/partner. So merchant/partner will call refund API to wallet to refund amount to user.

1. User could start refund request from the Mini Program or the merchant cashier (Step 1).
2. The merchant server calls /v1/payments/refund interface to refund (Step 2).
3. E-wallet returns the refund result to the merchant server (Step 3).
4. The merchant should return the refund result to the Mini Program or the merchant cashier (Step 4).

Request

copy

```
{
  "partnerId": "P00000000000001xxxx",
  "refundRequestId": "201911271907410100070000088881xxxx",
  "paymentId": "20191127190741010007000009999xxxx",
  "refundAmount": {
    "currency": "USD",
    "value": "10000"
  },
  "extendInfo": "{\"customerBelongsTo\":{\"siteNameExample\"}}"
}
```

- **partnerId** is the unique identifier of merchant/partner, assigned by wallte.
- **refundRequestId** is the unique ID of this refund request, generated by merchant/partner, merchant/partner should make sure it is unique, because wallet will use **partnerId** and **refundRequestId** to do idempotent process.
- **paymentId** is the payment ID generated by Wallet, which is the unique payment identifier associated with this refund.
- **refundAmount** describes 100 USD should refund to user, refund amount should less than origin payment amount. The amount to pay out for this **refund.refundAmount.currency** and **paymentAmount.currency** in payment request are the same. And if there are multiple refunds for a particular payment, the

total successful refunded amount cannot exceed the payment amount in the payment transaction.

- **extendInfo**, includes key - **customerBelongsTo** the e-wallet that the customer uses. Corresponding to the field 'siteName' that obtained from the API 'my.getSiteInfo', in the Mini Program scenario this is mandatory.

Note:

- **paymentId** and **paymentRequestId** can not both empty, wallet has to find out the origin payment order based on **paymentId** or **paymentRequestId**.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "refundId": "2019112719074101000700000019000xxxx",
  "refundTime": "2019-11-27T12:01:01+08:30"
}
```

- **result.resultStatus==S** shows that the *Wallet* refund is successful.
- **refundId** is generated by Wallet, uniquely identifies the refund.
- **refundTime** describes the success date time of this refund.

/v2/authorizations/applyToken

2021-05-09 18:43

POST /v2/authorizations/applyToken

The applyToken API is used to obtain the access token.

This interface can be used in the following cases:

- After the merchant receives **authCode** from Mini-Program, the merchant uses this interface to request the access token from e-wallet. In this scenario, the interface generally needs to be used with the Authorization Prepare Interface.
- When the original token expires, the merchant requests a new access token by using the refresh token. In this scenario, this interface can be used independently.

Message structure

Request

Property	Data type	Required	Description	Example
----------	-----------	----------	-------------	---------

|| authClientId | String | No | The unique identifier allocated for client.
 Max. length: 128 characters. | "202016726873874774774xxxx" || grantType | String | Yes
 | Indicates which parameter is to be used to obtain the access token. Possible values are:
 - AUTHORIZATION_CODE: the authCode is to be used to retrieve the accessToken
 - REFRESH_TOKEN: the refreshToken is to be used to retrieve the accessToken
 Max. length: 64 characters. | "AUTHORIZATION_CODE" || customerBelongsTo |
 String | NO | The e-wallet that the customer uses. Possible values are:
 - TRUEMONEY
 - ALIPAY_HK
 - TNG
 - ALIPAY_CN
 - GCASH
 - DANA
 - KAKAOPAY
 - BKASH

If you call the interface through AC, you must pass this parameter. | "TNG" || authCode | String | No | It is required when **grantType** is **AUTHORIZATION_CODE**.

The authorization code, which is used by confidential and public clients to exchange an authorization code for an access token. After the user returns to the client via the Mini-program API, the Mini-program will get the authorization code from the response of and use it to request an access token.

Max. length: 32 characters. | "28101113011GZcM9CjlF91WH00039190xxxx" ||
 refreshToken | String | No | **refreshToken** is required when
grantType is **REFRESH_TOKEN**.

The refresh token, which is used by the auth client to exchange for a new access token when the access token expires. By using the refresh token, new access tokens can be obtained without further interaction with the user.

Max. length: 128 characters. | "28101113011GZcM9CjlF91WH00039190xxxx" ||
 extendInfo | String | No | The extend information, wallets and merchants can put extending information in this property.

Max. length: 4096 characters. | "This is additional information" |

`result.resultMessage` is "An API calling is failed, which is caused by unknown reasons.".

For details, see the [Common error codes](#) section. || F | The request fails to send. AuthClient may guide user to try again.

The corresponding `result.resultCode` and `result.resultMessage` vary based on different situations. For details, see the following [Error codes](#) section. |

Error codes

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- API-specific error codes: are listed in the following table.

	<code>resultStatus</code>	<code>resultCode</code>	<code>resultMessage</code>
AUTH_CLIENT_UNSUPPORTED_GRANT_TYPE			The auth client do not support this grant type. F
INVALID_AUTH_CLIENT			The auth client is invalid. F
INVALID_AUTH_CLIENT_STATUS			Invalid auth client status. F
INVALID_REFRESH_TOKEN			The refresh token is invalid. F
EXPIRED_REFRESH_TOKEN			The refresh token is expired. F
USED_REFRESH_TOKEN			The refresh token has been used. F
INVALID_CODE			The authorization code is invalid. F
USED_CODE			The authorization code has been used. F
EXPIRED_CODE			The authorization code is expired. F
REFERENCE_CLIENT_ID_NOT_MATCH			The reference client id does not match. F
EXPIRED_AGENT_TOKEN			The access token of mini program is expired. F
INVALID_AGENT_TOKEN			The access token of mini program is invalid.

Sample

The authorization token application is used to exchange the access token based on the code after obtaining the code.

1. The Mini Program calls the `my.getAuthCode` interface to obtain the authorization code from e-wallet. (Step 1)
2. The e-wallet returns the authorization code to the Mini Program (Step 7)
3. The Mini Program sends authorization code to the merchant server (Step 8)
4. The merchant server calls the `applyTokeninterface` to apply for the access token from the e-wallet server and the e-wallet server returns the access token and customer ID to the merchant server. The access token should be kept in the merchant server only, which means that it should not be returned to the Mini Program. (Step 9 and Step 11).

Note: Other steps are covered by the e-wallet.

Request

A. Retrieving accessToken with authCode

copy

```
{
  "authClientId": "202016726873874774774xxxx",
  "grantType": "AUTHORIZATION_CODE",
  "authCode": "2810111301lGZcM9Cjlf91WH00039190xxxx"
}
```

B. Retrieving accessToken with refreshToken

copy

```
{
  "grantType": "REFRESH_TOKEN",
  "refreshToken": "2810111301lGZcM9Cjlf91WH00039190xxxx"
}
```

- **authCode** is from the my.getAuthCode JS-API, you can obtain the authCode in the success callback. when **grantType == AUTHORIZATION_CODE** means that we are requesting for the accessToken by the authCode.
- **refreshToken** is obtained from the response of the previous accessToken Application call. while **grantType == REFRESH_TOKEN** means that we are requesting for the accessToken by providing the refreshToken.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "accessToken": "281010033AB2F588D14B43238637264FCA5AAF35xxxx",
  "accessTokenExpiryTime": "2019-06-06T12:12:12+08:00",
  "refreshToken": "2810100334F62CBC577F468AAC87CFC6C9107811xxxx",
  "refreshTokenExpiryTime": "2019-06-08T12:12:12+08:00",
  "customerId": "1000001119398804xxxx"
}
```

- **result.resultStatus==S** shows that the application is successful,
- AuthClient can make use of **accessToken**,
281010033AB2F588D14B43238637264FCA5AAF35, to access the user's resource scope before 2019-06-06T12:12:12+08:00 [**accessTokenExpiryTime**].
- AuthClient can make use of **refreshToken**,
2810100334F62CBC577F468AAC87CFC6C9107811, to request for a new accessToken before 2019-06-08T12:12:12+08:00 [**refreshTokenExpiryTime**].

/v2/authorizations/applyToken

2022-07-05 23:31

POST /v2/authorizations/applyToken

With this API call, a merchant can obtain an access token from the super app. The merchant is then authorized by users to provide services on the mini program.

Note:

- Before calling this API, call the [my.getAuthCode](#) JSAPI to obtain an authorization code from the super app as the request parameter. Then call this API to exchange for an access token from the super app.
- When the original access token expires, use the refresh token to exchange for a new access token directly. In this scenario, this API can be used independently.
- An access token should be kept in the merchant server only, which means it should not be returned to the mini program.

Structure

A message consists of a header and body. The following sections are focused on the body structure. For the header structure, see:

- [Request header](#)
- [Response header](#)

Request parameters

Field	Data type	Required	Description	Example
appId	String	Yes	Indicates the unique ID assigned by Mini Program Platform to identify a mini program.	"3333010071465913xxx"

Note: Obtain this field via the [my.getAppIdSync](#) JSAPI or Mini Program Platform.

"3333010071465913xxx" | authClientId | String | Yes | Indicates the unique ID assigned by the super app to identify an authorized merchant.

- Maximum length: 128 characters
- Characters not allowed: special characters such as @ # ?

"202016726873874774774xxxx" || grantType | String | Yes | Indicates the way the authorized merchant obtains an access token. Valid values are:

- AUTHORIZATION_CODE: Exchange for an access token.
- REFRESH_TOKEN: Exchange for a new access token when the original one expires. || "AUTHORIZATION_CODE" || customerBelongsTo | String | No | Indicates the super app that a user uses. Valid values are:
 - ALIPAY_CN: Alipay CN
 - ALIPAY_HK: Alipay HK
 - ALIPAY_MO: Alipay MO
 - TNG: Touch 'n Go
 - GCASH: Gcash
 - DANA: Dana
 - KAKAOPAY: KakaoPay
 - BKASH: bKash
 - CHOPE: Chope
- TRUEMONEY: TrueMoney || "TNG" || authCode | String | No | The authorization code is used to exchange for an access token. Mini programs can obtain an authorization code via the **my.getAuthCode** JSAPI and then send it to the merchant. Then the merchant is authorized to use the authorization code to exchange for an access token.

- Maximum length: 64 characters
- Characters not allowed: special characters such as @ # ?
- Can be Null.

Note: This field is required when the value of *grantType* is AUTHORIZATION_CODE. | "2810111301lGZcM9Cjlf91WH00039190xxxx" || refreshToken | String | No | The refresh token is used to exchange for a new access token when the original one expires. With the refresh token, a new access token can be obtained without further interaction with the user.

- Maximum length: 128 characters
- Characters not allowed: special characters such as @ # ?
- Can be Null.

Note: This field is required when the value of *grantType* is REFRESH_TOKEN.
"28101113011GZcM9CjLF91WH00039190xxxx" || extendInfo | String | No | Indicates the extended information about this API.

- Maximum length: 4096 characters
- Characters not allowed: special characters such as @ # ?
- Can be Null. | copy

{
 "memo": "memo"
}
 |

Response parameters

Field	Data type	Required	Description	Example
<u>result</u>	<u>Result</u>	Yes	Indicates the request result such as status and error codes.	<pre>copy
{
 "resultCode": "SUCCESS",
 "resultStatus": "S",
 "resultMessage": "success"
}
</pre>
<u>accessToken</u>	String	No	The access token is used to access user information. For the specific information that can be accessed, see the my.getAuthCode JSAPI.	<ul style="list-style-type: none"> - Maximum length: 128 characters - Characters not allowed: special characters such as @ # ? - Can be Null. <p>Note: This field must be returned when the authorization request is successful.</p> <p>"281010033AB2F588D14B43238637264FCA5AAF35xxxx"</p> <p><u>accessTokenExpiryTime</u></p> <p>Datetime</p> <p>No</p> <p>Indicates when an access token expires. For example, in the payment scenario, once the access token expires, the authorized merchant cannot use this token to make payment requests.</p>

debit the user's account.

The value follows the [ISO 8601](#) standard format. For example, "2019-11-27T12:01:01+08:30".

Note: This field must be returned when the authorization request is successful. | "2019-06-06T12:12:12+08:00" || refreshToken | String | No | The refresh token is used to exchange for a new access token when the original one expires. With the refresh token, a new access token can be obtained without further interaction with the user.

- Maximum length: 128 characters
- Characters not allowed: special characters such as @ # ?
- Can be Null.

Note: This field must be returned when the authorization request is successful. | "2810100334F62CBC577F468AAC87CFC6C9107811xxxx" || refreshTokenExpiryTime | Datetime | No | Indicates when the refresh token expires. Once the refresh token expires, the authorized merchant cannot use this token to exchange for a new access token.

The value follows the [ISO 8601](#) standard format. For example, "2019-11-27T12:01:01+08:30".

Note: This field must be returned when the authorization request is successful. | "2019-06-08T12:12:12+08:00" || customerId | String | Yes | Indicates the unique ID assigned by Mini Program Platform to identify a user.

- Maximum length: 64 characters
- Characters not allowed: special characters such as @ # ? | "1000001119398804xxxx" || extendInfo | String | No | Indicates the extended information about this API.
- Maximum length: 4096 characters
- Characters not allowed: special characters such as @ # ?
- Can be Null.

Note:

- The *extendInfo.appCustomerId* assigned by the super app is passed to this field to identify a user.
- The *extendInfo.acqCustomerId* assigned by [Alipay merchant service](#) is also passed to this field to uniquely identify a user. | See [Response sample](#) for details. |

Result process logic

In the response, the *result.resultStatus* field indicates the result of processing a request. The following table describes each result status:

		Result status	Description
	---	---	The authorization request is successful. The corresponding <i>result.resultCode</i> is SUCCESS and the <i>result.resultMessage</i> is SUCCESS.
U			The status of the authorization request is unknown. The corresponding <i>result.resultCode</i> is UNKNOWN_EXCEPTION and <i>result.resultMessage</i> is "An API calling is failed, which is caused by unknown reasons.". For details, see the Common error codes section.
F			The authorization request is failed. The corresponding <i>result.resultCode</i> and <i>result.resultMessage</i> are various based on different situations. For details, see the following Error codes section.

Error codes

Error codes are usually classified into the following categories:

- [Common error codes](#) are common for all mini program OpenAPIs in V2.
- API-specific error codes are listed in the following table.

	Error code	Result status	Error message	Further action
AUTH_CLIENT_UNSUPPORTED_GRANT_TYPE	F	The authorized merchant does not support this grant type.	I Use a valid <i>grantType</i> such as AUTHORIZATION_CODE or REFRESH_TOKEN.	
INVALID_AUTH_CLIENT	F	Either the authorized merchant does not exist or the merchant does not onboard to the native app.	I Use a valid <i>authClientId</i> assigned by the super app.	
INVALID_AUTH_CLIENT_STATUS	F	The status of the authorized merchant is invalid.	I Contact <u>technical support</u> to troubleshoot the issue.	
INVALID_REFRESH_TOKEN	F	The refresh token does not exist.	I Obtain a new refresh token via this API.	
EXPIRED_REFRESH_TOKEN	F	The refresh token expires.	I Obtain a new authorization code from the super app via the my.getAuthCode JSAPI and then obtain a new refresh token via this API.	
USED_REFRESH_TOKEN	F	The refresh token has been used.	I Obtain a new refresh token via this API.	
INVALID_AUTHCODE	F	The authorization code does not exist.	I Obtain a new authorization code from the super app via the my.getAuthCode JSAPI.	
USED_AUTHCODE	F	The authorization code has been used.	I Obtain a new authorization code from the super app via the my.getAuthCode JSAPI.	
EXPIRED_AUTHCODE	F	The authorization code expires.	I Obtain a new authorization code from the super app via the my.getAuthCode JSAPI.	

Samples

The data flow to obtain an access token is illustrated as below:

1. The mini program calls the **my.getAuthCode** JSAPI to request an authorization code from the super app.
2. The super app processes the request and shows the information that needs to be authorized.
3. The user confirms the authorization in the super app.
4. The super app service processes the authorization information to the super app server.
5. The super app server verifies the authorization information and then generates the authorization code.
6. The super app server returns the authorization code to the super app service.
7. The super app service returns the authorization code to the mini program.
8. The mini program sends the authorization code to the merchant server.
9. The merchant server calls this API to exchange for an access token from the super app server.
10. The super app server verifies the authorization code and generates the access token.
11. The super app returns the access token to the merchant server.

Request

- Use an authorization code to exchange for an access token

copy

```
{
  "appId": "3333010071465913xxx",
  "authClientId": "202016726873874774774xxxx",
  "grantType": "AUTHORIZATION_CODE",
```

```

    "authCode": "2810111301lGZcM9Cj1F91WH00039190xxxx"
}
```

The mini program (3333010071465913xxx) calls the **my.getAuthCode** JSAPI to obtain the authorization code (2810111301lGZcM9Cj1F91WH00039190xxxx) and then send the authorization code to the merchant (202016726873874774xxxx). The merchant uses the authorization code to exchange for an access token as *grantType* is AUTHORIZATION_CODE.

- Use a refresh token to exchange for an access token

copy

```
{
  "grantType": "REFRESH_TOKEN",
  "refreshToken": "2810111301lGZcM9Cj1F91WH00039190xxxx"
}
```

The value of *grantType* is REFRESH_TOKEN, which means the merchant can obtain an access token by the refresh token (2810111301lGZcM9Cj1F91WH00039190xxxx).

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "accessToken": "281010033AB2F588D14B43238637264FCA5AAF35xxxx",
  "accessTokenExpiryTime": "2019-06-06T12:12:12+08:00",
  "refreshToken": "2810100334F62CBC577F468AAC87CFC6C9107811xxxx",
  "refreshTokenExpiryTime": "2019-06-08T12:12:12+08:00",
  "customerId": "1000001119398804xxxx",
  "extendInfo": "",
  {"appCustomerId": "200xxxx", "acqCustomerId": "300xxxx"}
}
```

- *result.resultStatus* is S, which shows the request to obtain an access token is successful.
- The authorized merchant can use the access token (281010033AB2F588D14B43238637264FCA5AAF35) before *accessTokenExpiryTime* (2019-06-06T12:12:12+08:00).
- 1000001119398804xxxx is the user who authorizes the merchant.
- The authorized merchant can use the refresh token (2810100334F62CBC577F468AAC87CFC6C9107811) to exchange for a new access token before *refreshTokenExpiryTime* (2019-06-08T12:12:12+08:00).

- *extendInfo* returns another two IDs to identify the user:
- *appCustomerId*: Indicates the ID assigned by the super app to identify a user.
- *acqCustomerId*: Indicates the ID assigned by Alipay merchant service to identify a user.

Last updated: 2022-07-05

Path: miniprogram_gcash

/v2/payments/pay

2022-07-05 23:31

POST /v2/payments/pay

The pay API is used to initiate a payment request to wallets.

Note: A payment which takes place at wallets .

- 1) The merchant/partner initiates a payment request to wallet through this interface.
- 2) The wallet will handle different payment scenarios based on the parameters in the request.

Currently, this API support following scenarios:

- Cashier payment: Usually used in the online payment scenario. In this scenario, the merchant/partner will call this API to create an order, and the wallet will return the cashier page URL to the merchant/partner, and then redirect to this cashier page. So user can finish the payment in the cashier page.

Message structure

Request

		Property	Data type	Required	Description	Example
appId String Yes The Mini Program app ID.						
Max. length: 32 characters. "3333010071465913xxx" productCode String No The product code, AGREEMENT_PAYMENT, IN_STORE_PAYMENT, CASHIER_PAYMENT						
Max. length: 32 characters. "CASHIER_PAYMENT" salesCode String No Defined by wallets. The wallet uses the salesCode to get the contract configuration which includes fee, limitation information, and so on.						
Max. length: 32 characters. "202011271xxx" paymentRequestId String Yes The unique ID of a payment generated by merchants.						
- Max. length: 64 characters.						
- This field is used for <u>idempotence</u> control. For the payment requests which are initiated with the same paymentRequestId and reach a final status (S or F), the wallet must return the unique result. "201911271907410100070000077771xxxx" paymentAmount Amount Yes The order amount, displaying users' consumption records, payment results page. {						
"currency": "USD",						
"value": "10000"						
} order Order No The purchase order details, such as Merchant, Buyer, Goods, etc. The information in the Order is only used to display user's payment result page and transactions history, regulation reporting, etc. It will not make use of the amount in the order for fund operation. {						
"referenceOrderId": "OrderID_0101010101xxxx",						
"orderDescription": "SHOES",						
"orderAmount": {						
"currency": "USD",						
"value": "10000"						
},						
"orderCreateTime": "2020-01-01T12:01:01+08:30",						
"merchant": {						
"referenceMerchantId": "M00000000001xxxx",						
"merchantMCC": "1405",						
"merchantName": "UGG Technology Limited",						
"merchantDisplayName": "UGG",						
"merchantAddress": {						
"region": "MY",						
"city": "KL"						
},						
"env": {						
"osType": "IOS",						
"terminalType": "APP"						
},						
} paymentMethod PaymentMethod No It is used to collect fund by wallets. {						
"paymentMethodType": "ID_000001xxxx",						
"paymentMethodId": "1"						
} paymentFactor PaymentFactor No In the Mini Program scenario, it is fixed value, map format. {						
"needSurcharge": true,						
"isPaymentEvaluation": false						
} paymentExpiryTime String/Datetime No The payment order close time defined by merchant,						

which follows the

ISO 8601 standard. | "2020-06-08T12:12:12+08:00" || paymentRedirectUrl | String | No |

The redirect URL defined by merchants.

Max. length: 1024 characters. | "https://www.merchant.com/redirectxxx" ||

paymentNotifyUrl | String | No | The payment success notification URL defined by merchants.

Max. length: 1024 characters. | "https://www.merchant.com/paymentNotifyxxx" ||

voidNotifyUrl | String(2048) | No | the url that void notification will be sent to. |||

extendInfo | String | No | The extensive information. The wallet and merchant can put extensive information in this property.

Max. length: 4096 characters. | "This is additional information" |

Response

	Property	Data type	Required	Description	Example
--	----------	-----------	----------	-------------	---------

|| result | **Result** | Yes | The request result, which contains information related to the request result, such as status and error codes. | {

```

    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
} || paymentId | String | No | The unique ID of a payment generated by Wallet.
Max. length: 64 characters. | "4374784884773748478499xxxx" || paymentTime | String/Datetime | No | Payment success time, which follows the ISO 8601 standard. | "2020-01-08T12:12:12+08:00" || redirectActionForm | RedirectActionForm | No |
Indicates a redirect URL. | {
    "method": "POST",
    "redirectionUrl": "https://www.wallet.com/cashier?orderId=xxxxxxx"
} || authExpiryTime | String/Datetime | No | The authorization expiry time, has value only when paymentFactor.isAuthorizationPayment is true. | "2020-07-08T12:12:12+08:00" || extendInfo | String | No | The extensive information. The wallet and merchant can put extensive information in this property.
Max. length: 4096 characters. | "This is additional information" |

```

Result process logic

In the response, the `result.resultStatus` field indicates the result of processing a request as follows.

|||| --- | --- | **resultStatus** | **Description** || S | The corresponding `result.resultCode` is "SUCCESS" and the `result.resultMessage` is "Success".

That means that this transaction is successful. The merchant/partner can update transaction to success. What needs to note is :

- In the payment evaluation scenario, 'S' just means that the evaluation is successful and there is no real fund transfer.

- In authorization payment scenario, 'S' just means that the authorization is successful, and need to wait for the capture operation to finish the transaction (finish the final fund flow). || A | The corresponding `result.resultCode` is "ACCEPT"; and the `result.resultMessage` varies based on different situations.

That means that the transaction is already accepted by wallets. The merchant/partner needs to continue the next operation according to the `redirectActionForm` response, such as display the order code to users or redirect to the wallet cashier page. || U | The corresponding `result.resultCode` is "UNKNOWN_EXCEPTION" and

`result.resultMessage` is "An API calling is failed, which is caused by unknown reasons.". For details, see the [Common error codes](#) section.

That means that unknown exception occurs on the wallet side. The merchant/partner can inquiry the payment result or wait for the payment status notification to get the real payment result. What needs to note is :

- Payment evaluation scenario can not be inquired.
- `U` status can not set to fail or success on the merchant/partner system.
- `U` status can not refund to users by offline (Maybe will make fund loss). || F | That means this transaction is failed. The corresponding `result.resultCode` and `result.resultMessage` vary based on different situations. For details, see the following [Error codes](#) section.

Usually the `F` transactions can not be successful again if use the same payment request to call wallets. |

Error codes

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- API-specific error codes: are listed in the following table.

```
||||| --- | --- | --- | | resultStatus | resultCode | resultMessage || U |
PAYMENT_IN_PROCESS | The payment is still under process. || A | ACCEPT | Need
next actions according to the
RedirectActionForm
field. || F | REPEAT_REQ_INCONSISTENT | Repeated submission, and requests are

```

Sample

Cashier Payment

For example, a user purchases a 100 USD good at the merchant/partner(online merchant usually) , the merchant/partner calls this API to create the payment order first, the wallet will return the payment order ID and wallet cashier page URL to the merchant/partner,

then merchant/partner can redirect user to wallet cashier page with the `my.tradePay` API.

1. The Mini Program creates an order.
2. The merchant server calls this pay interface with `paymentNotifyUrl` to initialize payment flow.
3. E-wallet server returns payment detail information with `paymentId` to the merchant server.
4. The merchant server passes the payment detail information to the Mini Program.
5. The Mini Program calls the `my.tradePay` interface to conduct the payment.
6. When the payment reaches the final status, the e-wallet server notifies the merchant server of the payment result with `paymentNotifyUrl` provided in Step 2 (Step 8).
7. Also the E-wallet App returns the payment result to the Mini Program (Step 9).

```

```

    "paymentNotifyUrl":"https://www.merchant.com/paymentNotifyxxx"
}

```

- **paymentRequestId** is generated by the merchant/partner, which uniquely identifies the payment. Wallet must make use of paymentRequestId for idempotent control. For example, if a payment with paymentRequestId==2019112719074101000700000077771 has been processed successfully by Wallet, when the merchant/partner uses the same paymentRequestId for payment, Wallet will respond with successful payment.
- **productCode** is the product code, including the IN_STORE_PAYMENT , CASHIER_PAYMENT, and AGREEMENT_PAYMENT information
- **paymentRedirectUrl** is the redirect URL defined by the merchant/partner. In the cashier payment scenario, after the user finished payment in the wallet cashier page, the wallet will direct back to merchant based on this URL.
- **paymentNotifyUrl** is the URL defined by the merchant/partner. In the cashier payment scenario, after the user finished payment in the wallet cashier page, the wallet will notify the merchant of the payment result based on this URL.
- **paymentAmount** describes the amount of 100 USD to be collected by Wallet from user's account for this payment.
- **order** describes the order details of the purchase of the 100CNY merchandise by the user at the merchant. Such as Merchant, Buyer, Goods, etc are included in order . The information in the Order is only used to display user's payment result page and transactions history, regulation reporting, etc. It will not make use of the amount in the order for fund operation.

Response

copy

```

{
  "result": {
    "resultCode": "ACCEPT",
    "resultStatus": "A",
    "resultMessage": "accept"
  },

/v2/payments/pay

2021-05-09 18:43

POST /v2/payments/pay

The pay API is used to initiate a payment request to wallets.

Note: A payment which takes place at wallets .

- 1) The merchant/partner initiates a payment request to wallet through this interface.
- 2) The wallet will handle different payment scenarios based on the parameters in the request.

Currently, this API support following scenarios:

- Cashier payment: Usually used in the online payment scenario. In this scenario, the merchant/partner will call this API to create an order, and the wallet will return the cashier page URL to the merchant/partner, and then redirect to this cashier page. So user can finish the payment in the cashier page.

Message structure

08T12:12:12+08:00" || extendInfo | String | No | The extensive information. The wallet
and merchant can put extensive information in this property.
Max. length: 4096 characters. | "This is additional information" |

```

Result process logic

In the response, the `result.resultStatus` field indicates the result of processing a request as follows.

||||---|---|| **resultStatus** | **Description** || S | The corresponding `result.resultCode` is "SUCCESS" and the `result.resultMessage` is "Success".

That means that this transaction is successful. The merchant/partner can update transaction to success. What needs to note is :

- In the payment evaluation scenario, 'S' just means that the evaluation is successful and there is no real fund transfer.
- In authorization payment scenario, 'S' just means that the authorization is successful, and need to wait for the capture operation to finish the transaction (finish the final fund flow). || A | The corresponding `result.resultCode` is "ACCEPT"; and the `result.resultMessage` varies based on different situations.

That means that the transaction is already accepted by wallets. The merchant/partner needs to continue the next operation according to the `redirectActionForm` response, such as display the order code to users or redirect to the wallet cashier page. || U | The corresponding `result.resultCode` is "UNKNOWN_EXCEPTION" and `result.resultMessage` is "An API calling is failed, which is caused by unknown reasons.". For details, see the [Common error codes](#) section.

That means that unknown exception occurs on the wallet side. The merchant/partner can inquiry the payment result or wait for the payment notification to get the real payment result. What needs to note is :

- Payment evaluation scenario can not be inquired.
- `U` status can not set to fail or success on the merchant/partner system.
- `U` status can not refund to users by offline (Maybe will make fund loss). || F | That means this transaction is failed. The corresponding `result.resultCode` and `result.resultMessage` vary based on different situations. For details, see the following [Error codes](#) section.

Usually the `F` transactions can not be successful again if use the same payment request to call wallets. |

Error codes

Error codes are usually classified into the following categories:

- Common error codes: are common for all Mini Program OpenAPIs.
- API-specific error codes: are listed in the following table.

	resultStatus	resultCode	resultMessage	U
PAYMENT_IN_PROCESS		The payment is still under process.	A ACCEPT Need next actions according to the RedirectActionForm field.	F
REPEAT_REQ_INCONSISTENT		Repeated submission, and requests are inconsistent.	F	
PAYMENT_AMOUNT_EXCEED_LIMIT		Payment amount exceeds limit.	F	
USER_NOT_EXIST		User not exist.	F	
USER_STATUS_ABNORMAL		The user status is abnormal.	F	
USER_BALANCE_NOT_ENOUGH		User balance is not enough for this payment.	F	
PARTNER_NOT_EXIST		Partner not exist.	F	
PARTNER_STATUS_ABNORMAL		Partner status abnormal.	F	
RISK_REJECT		Risk reject.	F	
CURRENCY_NOT_SUPPORT		The currency is not supported.	F	
ORDER_STATUS_INVALID		Order is in invalid status such closed.	F	
INVALID_ACCESS_TOKEN		Invalid access token.	F	
USER_AMOUNT_EXCEED_LIMIT		Payment amount exceeds user's amount limit.	F	
AUTH_CODE_ALREADY_USED		Auth code already used.	F	
INVALID_CODE		Auth code illegal.	F	
EXPIRED_AGENT_TOKEN		The agent token of mini program is expired.	F	
INVALID_AGENT_TOKEN		The agent token of mini program is invalid.	F

Last updated: 2022-07-05

Path: miniprogram_gcash

/v2/payments/refund

2022-07-05 23:31

POST /v2/payments/refund

The refund API is used to initiate a refund of a successful payment, refund a transaction and return money to the payer. The transaction can be refunded partially or fully. This API returns SUCCESS when deducting money from the merchant is successful.

Note:

1. The merchant/partner submits a refund request to wallets directly

2. Wallets determines whether the refund is successful based on its own payment status and respond to merchants/partners.
3. Multiple refund requests are supported for one successful payment, but the total refund amount can not be greater than the payment amount.

Message structure

Request

	Property	Data type	Required	Description	Example
	refundRequestId	String	Yes	The unique ID of a refund generated by merchants. - Max. length: 64 characters.	
	-	-	-	- This field is used for <u>idempotence</u> control. For the refund requests which are initiated with the same refundRequestId and reach a final status (S or F), the wallet must return the unique result.	"201911271907410100070000088881xxxx"
	paymentId	String	No	The unique ID of the corresponding original payment. Max. length: 64 characters.	"20191127190741010007000009999xxxx"
	paymentRequestId	String	No	The paymentRequestId for the corresponding original payment. Max. length: 64 characters.	"20200101234567890133333xxxx"
	refundAmount	Amount	Yes	Refund amount.	{ "currency": "USD", "value": "10000" }
	refundReason	String	No	Refund reason. Max. length: 256 characters.	"have returned goods to the shop"
	extendInfo	String	No	The extend information, wallets and merchants can put extending information in this property. Max. length: 4096 characters.	"This is additional information"

Response

	Property	Data type	Required	Description	Example
	result	Result	Yes	The request result, which contains information such as status and error codes.	{ "resultCode": "SUCCESS", "resultStatus": "S", "resultMessage": "success" }
	refundId	String	No	Unique refund order number. It is generated by Wallet, which uniquely identifies the refund. It is mandatory when the result.resultStatus is S.	"201911271907410100070000019000xxxx"
	refundTime	String/Datetime	No	Deduct money from merchant success time, after then will start to refund money to user. which follows the <u>ISO 8601</u> standard. It is mandatory when the result.resultStatus is S.	"2019-11-27T12:01:01+08:30"
	extendInfo	String	No	The extensive information returned by wallets. Max. length: 4096 characters.	"This is additional information"

Result Process Logic

In the response, the `result.resultStatus` field indicates the result of processing a request as follows.

||||---|---|| **resultStatus | Description** || S | The corresponding `result.resultCode` is "SUCCESS" and the `result.resultMessage` is "Success".

It means that the refund is successful, the merchant/partner can process as success. || A | The corresponding `result.resultCode` is "ACCEPT"; and the `result.resultMessage` varies based on different situations. || U | The corresponding `result.resultCode` is "UNKNOWN_EXCEPTION" and `result.resultMessage` is "An API calling is failed, which is caused by unknown reasons.". For details, see the [Common error codes](#) section.

It means that when handling the refund request, an unknown exception occurs. The merchant/partner can call the Refund Inquiry (`inquiryRefund`) API to query or retry this Refund (`refund`) API.

What needs to note is as follow:

- U status (inquiry/retry still gets U) can not set to fail or success on merchant/partner system.
- U status (inquiry/retry still gets U) should not refund/charge to user by offline (Maybe will make fund loss).

If other response (almost never occur), the merchant/partner should process like U. || F | That means this transaction is failed. The corresponding `result.resultCode` and `result.resultMessage` vary based on different situations.

It means that the refund is failed. The failure reasons can be the followings, but not limited to:

- The refund date time exceeds the allowable refund window (`result.resultCode = REFUND_WINDOW_EXCEED`).
- The refund amount is greater than the payment amount.

For details, see the following [Error codes](#) section. |

Error codes

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- API-specific error codes: are listed in the following table.

|||||---|---|---|| **resultStatus | resultCode | resultMessage** || U |
 REFUND_IN_PROCESS | Refund is under processing. || F |
 REPEAT_REQ_INCONSISTENT | Repeated submit, and requests are inconsistent. || F |
 PARTNER_STATUS_ABNORMAL | Partner status abnormal. || F |
 ORDER_NOT_EXIST | Order does not exist. || F | ORDER_STATUS_INVALID | Order status is invalid. || F | REFUND_WINDOW_EXCEED | Exceed Refund window. || F |
 REFUND_AMOUNT_EXCEED | The total refund amount has exceed the payment amount. || F | PARTNER_BALANCE_NOT_ENOUGH | The partner balance is not enough. || F | CURRENCY_NOT_SUPPORT | The currency is not supported. || F |
 EXPIRED_AGENT_TOKEN | The agent token of Mini Program is expired. || F |
 INVALID_AGENT_TOKEN | The agent token of Mini Program is invalid. |

Sample

For example, a wallet user applies for refund of 100 USD of a successful payment at the merchant/partner. So the merchant/partner will call this refund API to the wallet to refund money to users.

1. User can start a refund request from the Mini Program or the merchant cashier.
2. The merchant server calls this refund interface to refund.
3. E-wallet returns the refund result to the merchant server.
4. The merchant should return the refund result to the Mini Program or the merchant cashier.

Request

copy

```
{
  "refundRequestId": "201911271907410100070000088881xxxx",
  "paymentId": "20191127190741010007000009999xxxx",
  "refundAmount": {
    "currency": "USD",
    "value": "10000"
  }
}
```

- **refundRequestId** is the unique ID of this refund request, generated by merchant/partner, merchant/partner should make sure it is unique, because wallet will use **refundRequestId** to do idempotent process.
- **paymentId** is the payment ID generated by Wallet, which is the unique payment identifier associated with this refund.
- **refundAmount** describes 100 USD should refund to user, refund amount should less than origin payment amount. The amount to pay out for this **refund.refundAmount.currency** and **paymentAmount.currency** in **payment request** are the same. And if there are multiple refunds for a particular payment, the total successful refunded amount cannot exceed the payment amount in the payment transaction.

Note:

- **paymentId** and **paymentRequestId** can not both empty, wallet has to find out the origin payment order based on **paymentId** or **paymentRequestId**.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
```

```

    "resultMessage": "success"
},
"refundId": "201911271907410100070000019000xxxx",
"refundTime": "2019-11-27T12:01:01+08:30"
}

```

- **result.resultStatus==S** shows that the Wallet refund is successful.
- **refundId** is generated by Wallet, uniquely identifies the refund.
- **refundTime** describes the success date time of this refund.

} || `refundReason` | String | No | Refund reason.
 Max. length: 256 characters. | "have returned goods to the shop" || `extendInfo` | String | No | The extend information, wallets and merchants can put extending information in this property.
 Max. length: 4096 characters. | "This is additional information" |

Response

	Property	Data type	Required	Description	Example
result Result Yes The request result, which contains information such as status and error codes. {					
"resultCode": "SUCCESS", "resultStatus": "S", "resultMessage": "success"					
} <code>refundId</code> String No Unique refund order number. It is generated by Wallet, which uniquely identifies the refund.					
It is mandatory when the <code>result.resultStatus</code> is S.					
Max. length: 64 characters. "201911271907410100070000019000xxxx" <code>refundTime</code> String/Datetime No Deduct money from merchant success time, after then will start to refund money to user. which follows the <u>ISO 8601</u> standard. It is mandatory when the <code>result.resultStatus</code> is S. "2019-11-27T12:01:01+08:30" <code>extendInfo</code> String No The extensive information returned by wallets.					
Max. length: 4096 characters. "This is additional information"					

Result Process Logic

In the response, the `result.resultStatus` field indicates the result of processing a request as follows.

	resultStatus	Description	
--- --- S The corresponding <code>result.resultCode</code> is "SUCCESS" and the <code>result.resultMessage</code> is "Success".			
It means that the refund is successful, the merchant/partner can process as success. A The corresponding <code>result.resultCode</code> is "ACCEPT"; and the <code>result.resultMessage</code> varies based on different situations. U The corresponding <code>result.resultCode</code> is "UNKNOWN_EXCEPTION" and <code>result.resultMessage</code> is "An API calling is failed, which is caused by unknown reasons.". For details, see the <u>Common error codes</u> section.			

It means that when handling the refund request, an unknown exception occurs. The merchant/partner can call the Refund Inquiry (`inquiryRefund`) API to query or retry this Refund (`refund`) API.

What needs to note is as follow:

- U status (inquiry/retry still gets U) can not set to fail or success on merchant/partner system.

- U status (inquiry/retry still gets U) should not refund/charge to user by offline (Maybe will make fund loss).

If other response (almost never occur), the merchant/partner should process like U || F |
That means this transaction is failed. The corresponding `result.resultCode` and
`result.resultMessage` vary based on different situations.

It means that the refund is failed. The failure reasons can be the followings, but not limited to:

- The refund date time exceeds the allowable refund window (`result.resultCode = REFUND_WINDOW_EXCEED`).

- The refund amount is greater than the payment amount.

For details, see the following [Error codes](#) section. |

Error codes

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- API-specific error codes: are listed in the following table.

--- --- ---	resultStatus	resultCode	resultMessage	U
REFUND_IN_PROCESS	Refund is under processing.	F		
REPEAT_REQ_INCONSISTENT	Repeated submit, and requests are inconsistent.	F		
PARTNER_STATUS_ABNORMAL	Partner status abnormal.	F		
ORDER_NOT_EXIST	Order does not exist.	F	ORDER_STATUS_INVALID	Order status is invalid.
REFUND_WINDOW_EXCEED	Exceed Refund window.	F		
REFUND_AMOUNT_EXCEED	The total refund amount has exceed the payment amount.	F		
PARTNER_BALANCE_NOT_ENOUGH	The partner balance is not enough.	F		
CURRENCY_NOT_SUPPORT	The currency is not supported.	F		
EXPIRED_AGENT_TOKEN	The agent token of Mini Program is expired.	F		
INVALID_AGENT_TOKEN	The agent token of Mini Program is invalid.			

Sample

For example, a wallet user applies for refund of 100 USD of a successful payment at the merchant/partner. So the merchant/partner will call this refund API to the wallet to refund money to users.

1. User can start a refund request from the Mini Program or the merchant cashier.
2. The merchant server calls this refund interface to refund.
3. E-wallet returns the refund result to the merchant server.
4. The merchant should return the refund result to the Mini Program or the merchant cashier.

Request

copy

```
{
  "refundRequestId": "2019112719074101000700000088881xxxx",
  "paymentId": "201911271907410100070000009999xxxx",
  "refundAmount": {
    "currency": "USD",
    "value": "10000"
  }
}
```

- **refundRequestId** is the unique ID of this refund request, generated by merchant/partner, merchant/partner should make sure it is unique, because wallet will use **refundRequestId** to do idempotent process.
- **paymentId** is the payment ID generated by Wallet, which is the unique payment identifier associated with this refund.
- **refundAmount** describes 100 USD should refund to user, refund amount should less than origin payment amount. The amount to pay out for this **refund.refundAmount.currency** and **paymentAmount.currency** in payment request are the same. And if there are multiple refunds for a particular payment, the total successful refunded amount cannot exceed the payment amount in the payment transaction.

Note:

- **paymentId** and **paymentRequestId** can not both empty, wallet has to find out the origin payment order based on **paymentId** or **paymentRequestId**.

Response

copy

```
{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "refundId": "2019112719074101000700000019000xxxx",
  "refundTime": "2019-11-27T12:01:01+08:30"
}
```

- **result.resultStatus==S** shows that the Wallet refund is successful.
- **refundId** is generated by Wallet, uniquely identifies the refund.
- **refundTime** describes the success date time of this refund.

/v2/users/inquiryUserInfo {#/v2/users/inquiryuserinfo}

Last updated: 2022-07-05

Path: miniprogram_gcash

/v2/users/inquiryUserInfo

2022-07-05 23:31

POST /v2/users/inquiryUserInfo

With this API call, a merchant can inquire about user information with the access token. The specific information you can inquire about is defined in the **my.getAuthCode** JSAPI.

Structure

A message consists of a header and body. The following sections are focused on the body structure. For the header structure, see:

- [Request header](#)
- [Response header](#)

Request parameters

		Field	Data type	Required	Description	Example
appId	String	Yes	Indicates the unique ID assigned by Mini Program Platform to identify a mini program.			
-	Maximum length: 32 characters					
-	Characters not allowed: special characters such as @ # ?					
Note:	Obtain this field via the my.getAppIdSync JSAPI or Mini Program Platform. "3333010071465913xxx"	accessToken	String	Yes	The access token is used to access user information. For the specific information that can be accessed, see the my.getAuthCode JSAPI.	
-	Maximum length: 128 characters					
-	Characters not allowed: special characters such as @ # ?					
Note:	Obtain this field via the /v2/authorizations/applyToken API. "281010033AB2F588D14B43238637264FCA5AAF35xxxx"	authClientId	String			
Yes	Indicates the unique ID assigned by the super app to identify an authorized merchant.					
-	Maximum length: 128 characters					
-	Characters not allowed: special characters such as @ # ?					
"202016726873874774774xxxx"	extendInfo	String	No	Indicates the extended information about this API.		
-	Maximum length: 4096 characters					

- Characters not allowed: special characters such as @ # ?
- Can be Null. | copy

{
 "memo": "memo"
}
 |

Response parameters

Field	Data type	Required	Description	Example
result <u>Result</u> Yes Indicates the request result such as status and error codes. copy { "resultCode": "SUCCESS", "resultStatus": "S", "resultMessage": "success" } userInfo <u>User</u> No Indicates the user information that the merchant queried.				

Note:

- The *appUserId* assigned by the super app is passed to the *extendInfo* in the *userInfo* to uniquely identify a user.
- The *acqUserId* assigned by Alipay merchant service is passed to the *extendInfo* in the *userInfo* to uniquely identify a user. | See Response sample for details. |

Result process logic

In the response, the *result.resultStatus* field indicates the result of processing a request. The following table describes each result status:

Result status	Description
S The inquiry is successful. Use the <i>accessToken</i> to access user information within the corresponding scope.	
The corresponding <i>result.resultCode</i> is SUCCESS and the <i>result.resultMessage</i> is Success. U The status of the inquiry is unknown.	
The corresponding <i>result.resultCode</i> is UNKNOWN_EXCEPTION and <i>result.resultMessage</i> is "An API calling is failed, which is caused by unknown reasons.". For details, see the <u>Common error codes</u> section. F The inquiry is failed.	
The corresponding <i>result.resultCode</i> and <i>result.resultMessage</i> are various based on different situations. For details, see the following <u>Error codes</u> section.	

Error codes

Error codes are usually classified into the following categories:

- Common error codes are common for all mini program OpenAPIs in V2.
- API-specific error codes: are listed in the following table.

Error code	Result status	Error message	Further action
INVALID_AUTH_CLIENT F Either the merchant does not exist or the merchant does not onboard to the native app. Use a valid <i>authClientId</i> assigned by the super app.			
INVALID_ACCESS_TOKEN F The access token is not valid. Obtain a new authorization code via the my.getAuthCode JSAPI and then get a valid access token with the authorization code via the /v2/authorizations/applyToken API.			
EXPIRED_ACCESS_TOKEN F The access token is expired. Obtain a new access token with a refresh token via the /v2/authorizations/applyToken API.			

Samples

The data flow of inquiring about a user's information is illustrated as below:

1. The merchant server calls this API with the access token to inquire about the user's information.
2. The super app server returns the user's information to the merchant server based on the scopes of the access token.

Request

copy

```
{  
    "appId": "3333010071465913xxx",  
    "accessToken": "281010033AB2F588D14B43238637264FCA5AAF35xxxx",  
    "authClientId": "202016726873874774774xxxx"  
}
```

The merchant (202016726873874774774xxxx) uses the access token (281010033AB2F588D14B43238637264FCA5AAF35xxxx) to access the user's specific information.

Response

copy

```
{  
    "result": {  
        "resultCode": "SUCCESS",  
        "resultStatus": "S",  
        "resultMessage": "success"  
    },  
    "userInfo": {  
        "userId": "1000001119398804xxxx",  
        "status": "ACTIVE",  
        "nickName": "Jack",  
        "userName": {  
            "fullName": "Jack Sparrow",  
            "firstName": "Jack",  
            "lastName": "Sparrow"  
        },  
        "avatar": "http://example.com/avatar.htm?avatarId=FBF16F91-28FB-  
47EC-B9BE-27B285C23CD3xxxx",  
        "gender": "MALE",  
        "birthDate": "2020-07-25",  
        "nationality": "US",  
        "loginIdInfos": [\n    ]  
    }  
}
```

```
{
    "loginId": "1116874199xxx",
    "loginIdType": "MOBILE_PHONE"
},
],
"contactInfos": [
    {
        "contactNo": "1116874199xxx",
        "contactType": "MOBILE_PHONE"
    }
],
"extendInfo": "
{\\"appUserId\\":\\"200xxxx\\",\\"acqUserId\\":\\"300xxxx\\"
}
}
```

- *result.resultStatus* is S, which means the inquiry request is successful.
- *userInfo* describes the user's information you get via the **inquiryUserInfo** API. The information includes *userId*, *status*, *nickName*, *userName*, *avatar*, *gender*, *birthDate*, *nationality*, *loginIdInfos*, *contactInfos*, and *extendInfo*.

ACSS Reference {#acss-reference}

Last updated: 2021-05-09

Path: miniprogram_gcash

ACSS Reference

2021-05-09 18:43

The **acss** is used to describe the page style. It is a set of style language, used to describe the axml component style and decide the displaying mode of axml component.

To facilitate most front-end developers, our acss has the most features of css. Meanwhile, we extend the css so that it is more suitable for Mini Program.

In contrast to css, our extension features include:

Rpx

The **rpx**(Responsive Pixel) can adapt with screen width specification 750rpx. Take the iPhone6 as an example. The screen width is 375px and has total 750 physical pixels, $750\text{rpx} = 375\text{px} = 750$ physical pixels, $1\text{rpx} = 0.5\text{px} = 1$ physical pixel.

```
||||| --- | --- | --- || Device | rpx converted to px (screen width / 750) | px converted to
rpx (750 / screen width) || iPhone5 | 1rpx = 0.42px | 1px = 2.34rpx || iPhone6 | 1rpx =
0.5px | 1px = 2rpx || iPhone6 Plus | 1rpx = 0.552px | 1px = 1.81rpx |
```

Style Import

Use the `@import` statement to import external style sheets. The `@import` should be followed with the relative path of external style sheet, with “;” indicating the end.

Sample codes:

copy

```
/** button.acss */
.sm-button {
  padding: 5px;
}
```

copy

```
/** app.acss */
@import "./button.acss";
.md-button {
  padding: 15px;
}
```

The import path supports node_modules directory loading third-party module, such as page.acss:

copy

```
@import "./button.acss"; /*relative path*/
@import "/button.acss"; /*project absolute path*/
@import "third-party/page.acss"; /*third-party npm package path*/
```

Inline Style

The component supports the use of **style**, **class** attribute to control style.

Style Attribute

Used to receive dynamic style, style will be parsed in running. The !important priority rule is not supported.

copy

```
<view style="color:{{color}};" />
```

Class Attribute

Used to receive static style. The attribute value is the set of class selector name (style class name) in the style rules. The style class name does not need the ".", and uses space to separate each other.

copy

```
<view class="my-awesome-view" />
```

Static style is uniformly written into class. Do not write static style into style, otherwise the render speed will be affected.

Selector

Same as css3.

Note:

- The class selectors starting with .a- and .am- are occupied by the system component. Do not use them.
- Attribute selector is not supported.

Global Style and Local Style

The style defined in the app.acss is **global style** and acts on every page.

The style defined in the acss file of the page is **local style** and acts on only the corresponding page. It overwrites the same selector in app.acss.

Page Container Style

The **page** element selector is used to set the page container style, such as the page background color:

copy

```
page {  
  background-color: red;  
}
```

Local Reference

Please use absolute path to refer local file in ACSS, relative path is not supported.

copy

```
/* Supported */
background-image: url('/images/mini-program.png');
/* Not supported */
background-image: url('./images/mini-program.png');
```

FAQ

Q: How to solve the style pollution when an axml includes multiple custom component or template?

A: Please use namespace to separate them up.

Q: The 100% height is invalid, why?

A: Add absolute position to solve it, or it will adjust the height according to the content height in the page.

ACSS Reference

2022-07-03 18:44

The **acss** is used to describe the page style. It is a set of style language, used to describe the axml component style and decide the displaying mode of axml component.

To facilitate most front-end developers, our acss has the most features of css. Meanwhile, we extend the css so that it is more suitable for Mini Program.

In contrast to css, our extension features include:

Rpx

The **rpx**(Responsive Pixel) can adapt with screen width specification 750rpx. Take the iPhone6 as an example. The screen width is 375px and has total 750 physical pixels, $750\text{rpx} = 375\text{px} = 750$ physical pixels, $1\text{rpx} = 0.5\text{px} = 1$ physical pixel.

```
||||| --- | --- | --- || Device | rpx converted to px (screen width / 750) | px converted to
rpx (750 / screen width) || iPhone5 | 1rpx = 0.42px | 1px = 2.34rpx || iPhone6 | 1rpx =
0.5px | 1px = 2rpx || iPhone6 Plus | 1rpx = 0.552px | 1px = 1.81rpx |
```

Style Import

Use the `@import` statement to import external style sheets. The `@import` should be followed with the relative path of external style sheet, with “;” indicating the end.

Sample codes:

copy

```
/** button.acss */
.sm-button {
  padding: 5px;
}
```

copy

```
/** app.acss */
@import "./button.acss";
.md-button {
  padding: 15px;
}
```

The import path supports node_modules directory loading third-party module, such as page.acss:

copy

```
@import "./button.acss"; /*relative path*/
@import "/button.acss"; /*project absolute path*/
@import "third-party/page.acss"; /*third-party npm package path*/
```

Inline Style

The component supports the use of **style**, **class** attribute to control style.

Style Attribute

Used to receive dynamic style, style will be parsed in running. The `!important` priority rule is not supported.

copy

```
<view style="color:{{color}};" />
```

Class Attribute

Used to receive static style. The attribute value is the set of class selector name (style class name) in the style rules. The style class name does not need the ".", and uses space to separate each other.

copy

```
<view class="my-awesome-view" />
```

Static style is uniformly written into class. Do not write static style into style, otherwise the render speed will be affected.

Selector

Same as css3.

Note:

- The class selectors starting with .a- and .am- are occupied by the system component. Do not use them.
- Attribute selector is not supported.

Global Style and Local Style

The style defined in the app.acss is **global style** and acts on every page.

The style defined in the acss file of the page is **local style** and acts on only the corresponding page. It overwrites the same selector in app.acss.

Page Container Style

The **page** element selector is used to set the page container style, such as the page background color:

copy

```
page {  
  background-color: red;  
}
```

Local Reference

Please use absolute path to refer local file in ACSS, relative path is not supported.

copy

```
/* Supported */  
background-image: url('/images/mini-program.png');
```

```
/* Not supported */
background-image: url('./images/mini-program.png');
```

FAQ

Q: How to solve the style pollution when an axml includes multiple custom component or template?

A: Please use namespace to separate them up.

Q: The 100% height is invalid, why?

A: Add absolute position to solve it, or it will adjust the height according to the content height in the page.

});

```

Attributes

		Property	Description	Type	Default	Required
value	Component value, the value carried with the change event when checked.	String	-	No	checked	Checked or not, allowing the checked setting by default.
false	No	disabled	Disable or not.	Boolean	false	false
function	No	onChange	Callback function triggered by the change event.	(e: Object) => void	-	No
for	id		Works with the for attribute of the label component.	String	-	No

AMIcon {#amicon}

Last updated: 2022-07-03

Path: miniprogram_gcash

AMIcon

2022-07-03 18:44

Icon.

Note:

- It is recommended to use font with small size.
- The Amicon does not support the onTap event, while a view tag can be added to its exterior.
- AMIcon is the extension component encapsulated with customized components where no click event is available.

The click event bound on it will not work. It is possible to find the source codes in modules, and modify the code to add the click event.

Sample Code

copy

```
// API-DEMO page/component/am-icon/am-icon.json
{
  "defaultTitle": "Mini Program AntUI component library",
  "usingComponents": {
    "am-icon": "mini-antui/es/am-icon/index"
  }
}
```

copy

```
<!-- API-DEMO page/component/am-icon/am-icon.axml -->
<view>
  <view class="icon-title">Basics </view>
  <view class="icon-list">
    <block a:for="{{basicTypes}}">

AMRadio {#amradio}

Last updated: 2022-07-03

Path: miniprogram_gcash

AMRadio

2022-07-03 18:44

You can use the am-radio component to allow users to select radio buttons. The specific usage is consistent with the basic radio component, but more styles are added in the extended am-switch component.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "am-radio",
  "usingComponents": {
    "am-radio": "mini-ali-ui/es/am-radio/index",
    "list": "mini-ali-ui/es/list/index",
    "list-item": "mini-ali-ui/es/list/list-item/index"
  }
}
```

.axml

copy

```
<view class="page">
  <view class="page-description">AMRdiao</view>
  <view class="page-section">
    <view class="section section_gap">
      <form onSubmit="onSubmit" onReset="onReset">
        <view class="page-section-demo">
          <radio-group class="radio-group" onChange="radioChange" name="lib">
            <label class="radio" a:for="{{items}}" key="label-{{index}}">
              <am-radio value="{{item.value}}" checked="{{item.checked}}" disabled="{{item.disabled}}"/>
              <view style="display:inline-block;">{{item.desc}}</text>
            </label>
          </radio-group>
        </view>
        <view class="page-section-demo">
          <radio-group class="radio-group" onChange="radioChange" name="lib">
            <label class="radio" a:for="{{items1}}" key="label-{{index}}">
              <am-radio value="{{item.value}}" checked="{{item.checked}}" disabled="{{item.disabled}}"/>
              <view style="display:inline-block;">{{item.desc}}</text>
            </label>
          </radio-group>
        </view>
      </form>
    </view>
  </view>
</view>
```

.acss

copy

```
.radio {
  display: flex; align-items: center;
```

```

    }
  .page-section-demo {
    padding: 24rpx;
}

```

.js

copy

```

Page({
  data: {
    items: [
      { checked: true, disabled: false, value: 'a', desc: 'AMRadio-
checked', id: 'checkbox1' },\
      { checked: false, disabled: false, value: 'b', desc: 'AMRadio-
unchecked', id: 'checkbox2' },\
    ],
    items1: [
      { checked: true, disabled: true, value: 'c', desc: 'AMRadio-
checked disabled', id: 'checkbox3' },\
    ],
  },
  radioChange() {
  },
});

```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || value | String | Component value.
When the radio is selected, the component value is obtained by the onChange event. ||
checked | Boolean | An indicator of whether the radio is selected. The default value is
false. || disabled | Boolean | An indicator of whether to disable the radio selection. The
default value is false. || id | String | Radio ID, which is used in combination with the *for*
property of the label component. |

Axml Introduction

2022-07-03 18:44

Axml is a set of markup language for Mini Program framework design and used to describe the structure of Mini Program pages. The Axml syntax falls into five parts: data binding, conditional rendering, list rendering, template and file reference.

Axml code sample:

copy

```
<!-- pages/index/index.axml -->
<view a:for="{{items}}> {{item}} </view>
<view a;if="{{view == 'WEBVIEW'}}> WEBVIEW </view>
<view a:elif="{{view == 'APP'}}> APP </view>
<view a:else> hello </view>
<view onTap="add"> {{count}} </view>
```

.js sample:

copy

```
// pages/index/index.js
Page({
  data: {
    items: [1, 2, 3, 4, 5, 6, 7],
```

```

        view: 'hello',
        count: 1,
    },
    add(e) {
        this.setData({
            count: this.data.count + 1,
        });
    },
);

```

.css sample:

copy

```

/* pages/index/index.acss */
view {
    padding-left: 10px;
}

```

Display result:

About App Container

2021-05-09 18:43

App Container is a productive and secure runtime system that can run beautiful Mini Programs on mobile platforms of Android and iOS in any apps that are integrated with Mini Programs.

Features

You can benefit from the following features available:

Fast Development

You get a uniform and standardized application development experience. Code once, and the Mini Program can run on both Android and iOS apps. App Container provides developers with infrastructure APIs to easily access album, contact, device, storage or network status.

Expressive and Flexible UI

App Container provides rich UI components such as scroll-view, progress, slider, switch, picker, navigator and canvas, which allow developers to realize their idea more quickly. With App Container API, you can easily customize the user experience of title bar, loading view, error view and other UI components.

High Performance

You can easily ship a Mini Program to the app bundle and launch it fast in the offline mode. High Performance Renderer in the App Container allows Mini Program to be rendered fast, so that you can get a fast response.

Contact Us

Send us an email at and integrate App Container today.

About Mini Program {#about-mini-program}

Last updated: 2022-06-28

Path: miniprogram_gcash

About Mini Program

2022-06-28 23:11

Mini Program is a new technology that helps merchants to quickly develop high-quality services and grow business on mobile apps. It can be easily acquired with a good user experience for mobile users.

What is Mini Program

As is known to all that mobile web technology can help to move the business forward quickly with its flexibility. Mini Program is a mini app that can provide as many services to users as the mobile native app, without installing the mobile app.

The main development language of Mini Program is JavaScript, and the development experience of the Mini Program is similar to that of web development. For developers, the migration cost of moving HTML5 app to Mini Program is kept to a minimum. For more information, see [How to transform an HTML 5 mobile app to an HTML 5 mini program](#).

The following diagram illustrates how mini programs works for developers and users:

Picture 1 Mini Program Overview

Differences between Mini Program development and web development

As shown above, the App Container is the runtime of a DSL(Domain Specific Language) Mini Program. The render engine and JS engine are independent of each other so they can run in parallel. On the other hand, in web development, they run in serial and a longtime-running script may cause non-responsive UI.

Web developers can use DOM APIs provided by the browser to perform DOM selection and operation. In Mini Program development, we practice separation of concerns and make UI rendering and JS business logic into distinct sections. While the UI layout is provided by the declarative `axml` language, the JS business layer does not include DOM manipulation and therefore, JS objects such as `window` or `document` are not available in Mini Program JS layer. This design makes some DOM-dependent JS libraries, such as `jQuery`, unavailable. Also, the JS layer does not include `Node.js` runtime, so certain `Node.js`-specific NPM packages can not be used in the Mini Program project.

Why using Mini Program

As is known to all, an HTML5 app is sandboxed and has its limitation to access native device capability, such as the reliable network, the powerful storage abilities, etc. And users may wait for HTML5 resource downloading for a long time because of poor network connection, which may cause white-screen issues frequently. Besides, smooth transitions can not be achieved in HTML5 since the page switching and the tapping are delayed frequently. Last but not least, the unresponsive UI may hurt the user experience.

You can benefit from Mini Programs with the following features:

- Acquiring App services without installing Apps
- Faster loading
- More powerful capacities
- Almost native experience
- Efficient and simple development

The operating environments of Mini Program

The operating environments of Mini Program include the two major mobile Operating Systems (OSs): iOS and Android. The development tool of Mini Program (IDE) is Mini Program Studio. These three operating environments of Mini Program are also different in their working mechanism, as shown in Table 1:

Table 1. Mini Program operating environment

Alphabet {#alphabet}

Last updated: 2022-07-03

Path: miniprogram_gcash

Alphabet

2022-07-03 18:44

You can use the alphabet component to arrange content in the alphabetical order.

Sample code

.json

copy

```
{  
  "defaultTitle": "Alphabet",  
  "usingComponents":{  
    "alphabet": "mini-ali-ui/es/list/alphabet/index",  
    "am-icon": "mini-ali-ui/es/am-icon/index"  
  }  
}
```

.axml

copy

```
<view style="position: relative; height: 100vh;">  
  <alphabet alphabet="{{alphabet}}" onClick="onAlphabetClick" >  
    <view slot="prefix"><am-icon size="12" type="check_" /></view>  
  </alphabet>  
</view>
```

.js

copy

```
Page({
  data: {
    alphabet: ['A', 'B', 'C', 'D', 'E', 'F', 'G', 'H', 'I', 'J', 'K',
    'L', 'M', 'N', 'O', 'P', 'Q', 'R', 'S', 'T', 'U', 'V', 'W', 'X', 'Y',
    'Z'],
  },
  onAlphabetClick(ev) {
    my.alert({
      content: JSON.stringify(ev.data),
    });
  },
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || alphabet | Array | The alphabet that consists of letters. |

Note:

The content is displayed by using the list component.

Am-Switch {#am-switch}

Last updated: 2022-07-03

Path: miniprogram_gcash

Am-Switch

2022-07-03 18:44

You can use the am-switch component to change the state on or off. The specific usage is consistent with the basic switch component, but more styles are added in the extended am-switch component.

Note:

In iOS, the switch shape is round, while in Android the switch shape is square.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "am-switch",
  "usingComponents": {
    "am-switch": "mini-ali-ui/es/am-switch/index"
  }
}
```

.axml

copy

```
<view class="page">
  <view class="page-description">am-switch</view>
  <view class="page-section">
    <view class="page-section-demo switch-list">
      <view class="switch-item">
        <am-switch checked onChange="switch1Change"/>
      </view>
      <view class="switch-item">
        <am-switch color="red" checked />
      </view>
    </view>
  </view>
</view>
```

.js

copy

```
Page({
  switch1Change(e) {
    console.log('switch1 happen change event carried value is',
e.detail.value);
  },
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || name | String | Component name, which is used to obtain data by submitting the form. || checked | Boolean | An indicator of whether the state is on. The default value is **false**. || disabled | Boolean | An indicator

of whether to disable the switch. The default value is `false`.
|| `onChange` | (e: Object) => void | The event that is triggered when users change the state.
|| `color` | String | Component color. Specify the color value in CSS.
|| `controlled` | Boolean | An indicator of whether the component is controlled. The default value is `false`. If the value is `true`, the value of `checked` is controlled by `setData`.

AmountInput

2022-07-03 18:44

Amount input box

Sample Code

copy

```
// API-DEMO page/component/amount-input/amount-input.json
{
  "defaultTitle": "Mini Program AntUI component library",
  "usingComponents": {
    "amount-input": "mini-antui/es/amount-input/index"
  }
}
```

copy

```
<!-- API-DEMO page/component/amount-input/amount-input.axml -->
<view>
  <amount-input
    type="digit"
    title="Charge amount"
    extra="Suggest charge amount above ¥100 "
    placeholder="Enter charge amount"
    value="{{value}}"
    maxLength="5"
    focus="{{true}}"
    btnText="Withdraw all"
    onClear="onInputClear"
```

```

        onInput="onInput"
        onConfirm="onInputConfirm" />
    </view>

```

copy

```

// API-DEMO page/component/amount-input/amount-input.js
Page({
    data: {
        value: 200,
    },
    onInputClear() {
        this.setData({
            value: '',
        });
    },
    onInputConfirm(e) {
        console.log(e);
        my.alert({
            content: 'confirmed',
        });
    },
    onInput(e) {
        console.log(e);
        const { value } = e.detail;
        this.setData({
            value,
        });
    },
    onButtonClick() {
        my.alert({
            content: 'button clicked',
        });
    },
    onInputFocus(e) {
        console.log(e);
    },
    onInputBlur(e) {
        console.log(e);
    },
});

```

Attributes

	Property	Description	Type	Default	Required	
	Type of input, effective values include digit and number.	String number No	title			
	Title in the upper-left corner.	String - No	extra	Description in the bottom-right corner.	String - No	
	value Current value of the input box.	String - No	btnText			
	Text of the bottom-right corner button.	String - No	placeholder	Placeholder		
	focus Get cursor automatically.	Boolean false No	onInput	Trigger on keyboard input.	(e: Object) => void - No	onFocus Trigger on getting focus.
	(e: Object) => void					

Object) => void | - | No || onBlur | Trigger on losing focus. | (e: Object) => void | - | No || onConfirm | Trigger on clicking keyboard completion. | (e: Object) => void | - | No || onClear | Trigger on clicking clear icon. | () => void | - | No || onButtonClick | Trigger on clicking bottom-right corner button. | () => void | - | No || maxLength | Maximum number of characters allowed for input. | Number | - | No || controlled | Is controlled component or not If true, value contents are under full control of setData. | Boolean | false | No |

Analytics {#analytics}

Last updated: 2022-07-07

Path: miniprogram_gcash

Analytics

2022-07-07 17:08

The Analytics functionality helps you to see the performance of all your mini programs. You can see the basic analytics data of all the released mini programs under **Default Analysis**. In addition, you can create events for your customized analysis. Data collected by events are displayed under **My Analysis**.

Note:

Events are used to collect data and analyze user behavior.

Default analysis

The following data are available under the **Default Analysis** tab:

- Summary of your mini programs

You can see the total number of mini programs. You can also sort mini programs according to the status. For example, fully released and grayscale releasing.

- Performance of all the released mini programs

You can analyze mini programs' performance by tracking its unique visitors, page views, new users, and total users.

- Performance of each released mini program

Go to **Performance of Each Mini Program** and click on the name of the mini program you would like to see in detail.

- Performance of each mini program

Under the **Performance** tab, you can see the historical performance of each mini program. See [Performance](#) for details.

- Real-time analytics data of each mini program

Under the **Real-Time Analysis** tab, you can see:

- Number of users and page visits of the current day.
- Data on each individual page of the mini program, such as the number of times that the page was shared.
- Ratio between the different versions used by users.
- Payment success rate.

See [Real-Time Analysis](#) for details.

Customized analysis

Under the **My Analysis** tab, you can find the list of all the mini programs. You can click on each mini program to customize its analysis in the following ways:

- Manage events for each mini program

Under the **Manage Event** tab, you can customize events or API fields to collect and report data on user behavior. See [Event management and analysis](#) for details.

- Manage funnels for each mini program

Under the **Manage Funnel** tab, you can customize funnels to analyze the user conversion. See [Funnel management and analysis](#) for details.

Analyze events and funnels {#analyze-events-and-funnels}

Last updated: 2022-07-07

Path: miniprogram_gcash

Analyze events and funnels

2022-07-07 17:08

After you publish an event, you can analyze the event and see user behavior for this event. In addition, you can also see the user flow across several events, which is enabled by funnel analysis. To learn more about events and funnels, see [Event management and analysis](#) and [Funnel management and analysis](#).

Events analysis

Prerequisites

Make sure you have defined and published an event. For more information, see [define an event and publish an event](#).

Procedures

1. Go to **Analytics > Performance > My Analysis**;
2. Choose the mini program that you want to perform data analysis on, then click **Manage Event**.
3. Define filter conditions for this report.

Take the "add a product to the shopping cart" event as an example. You need to configure the event analysis with the following parameters:

- **Event:** The event to be analyzed. For this event, `addCommodityToSoppingCart` is chosen.
- **Metric:** Metrics are the fields that were previously defined for the event. These are the dimensions that you can analyze for the event. For example, selecting `addToShoppingCarNum` and `Sum` will indicate the total number of products in the shopping cart. In addition, you can also choose PV and UV as metrics.
- **Filter(Optional):** Data filter conditions. You can apply filter conditions to all the fields that you have previously defined for the event.
- **Date Range:** The period when the event was triggered.
- **Time Granularity:** Choose either daily or hourly.

After setting the event analysis configurations, click **Apply**. You can view the analysis results in the form of a graph or table accordingly.

Analysis:

- On March 9, 2021, the total number of products added to the shopping cart is 13;
- On March 10, 2021, the total number of products added to the shopping cart is 26;
- On March 11, 2021, the total number of products added to the shopping cart is 13.

Funnel analysis

To analyze a funnel, complete the following steps:

Prerequisites

Funnel analysis helps you analyze several steps of the user flow. Make sure you have defined and published at least two events. For more information, see [define an event](#) and [publish an event](#).

Procedures

1. Create a funnel

1. Go to **Analytics > Performance > My Analysis**;
2. Choose the mini program that you want to perform data analysis on;
3. Click **Manage Funnel** under the **Manage Funnel** tab;
4. Click **+ New Funnel**.

2. Enter the funnel name

3. Set funnel steps

Take "user shopping path conversion rate" funnel as an example:

- **Steps:** Each step corresponds to an event. You can choose multiple events that are already defined. For this funnel example, select the `addCommodityToShoppingCart`, `submitOrder`, and `payOrder` steps.
- **Filter(Optional):** Data filter conditions. You can apply filter conditions to all the fields that you have previously defined for the event. In step 3, set `payStatus` is equal to `true`, which filters orders that have been successfully paid.

copy

```
data: {  
  orderList: [],  
  totalItems:0,  
  commodityAmount:0,  
  orderAmount:0,  
  totalDiscount:10,  
  shopDiscount:3,  
  freightAmount:9,  
  orderId:"",  
  payStatus:"false",  
}
```

After confirming each step, click **Save** to save the current configuration.

4. Analyze data

After setting funnel steps, go back to the funnel management page to set funnel analysis conditions and perform customized data analysis.

- **Funnel:** Select the userShoppingPathConversionRate that you have already created.
- **Date Range:** Select the data range to calculate overall funnel conversion. For this funnel example, March 5, 2021 - March 11, 2021 is selected as the range.

After setting funnel analysis conditions, click **Apply**. You can view the analysis results in the form of a graph or table.

Analysis:

- From March 5, 2021 to March 11, 2021, a total of 52 products were added to the shopping cart, of which 32 of which were submitted as orders, and 28 of the submitted orders were successfully paid for.
- The conversion rates among the three events are 61.54% and 87.50% respectively.

Based on the funnel analysis, you can start your investigations on user behavior.

App Introduction

2022-07-03 18:44

Introduction

App() represents top-level applications and manages all pages and global data and provides lifecycle method. It is also a construction method, for generating the App instance.

A Mini Program is an App instance.

Typically, at the root directory of each Mini Program, there are three files.

- app.js: application logic
- app.acss: application style (optional)

- app.json: application configuration

Sample

Here is a simple app.json.

copy

```
{  
  "pages": [\\"  
    "pages/index/index", \  
    "pages/logs/index"\\  
  ],  
  "window": {  
    "defaultTitle": "Demo"  
  }  
}
```

The configuration above indicates that two pages are included in the Mini Program, and the default title is Demo for the application.

A simple app.js code is shown below. It has four life-cycle methods.

copy

```
App({  
  onLaunch(options) {  
    // called when opened  
  },  
  onShow(options) {  
    // called when opened or come foreground  
  },  
  onHide() {  
    // called when it goes background  
  },  
  onError(msg) {  
    // called on JavaScript error or API invoke exception  
    console.log(msg)  
  },  
  // global data  
  globalData: {  
    foo: true,  
  }  
)
```

Apply for an account {#apply-for-an-account}

Last updated: 2021-05-09

Path: miniprogram_gcash

Apply for an account

2021-05-09 18:43

Before developing a Mini Program, you need to create a developer account, which allows you to create, develop or publish your Mini Program.

Please ask the workspace admin to invite you to join the workspace to be a Mini Program admin or a Mini Program developer. Note that developer can develop the Mini Program, and only the Mini Program admin can create and publish the Mini Program.

By clicking the link within the invitation email you received, you can create your account as below.

Fill in the information, then you can finish the account creation process.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/quick-start_create-account

Approvals

2022-07-07 17:08

With the Approval Manage functionality, you can query and process approval requests depending on your role.

Features

Depending on your role, you can benefit from all or some of the following features:

- Query approval requests

- Under Approval Requests, workspace admins and workspace reviewers can check all the received approval requests in a list and filter them by Category or Status.
- Under My Applications, you can check approval requests that you submitted in a list and filter them by Category or Status.
- Process approval requests

You can approve or reject the received approval requests. This feature is available for workspace admins and workspace reviewers.

Approval request details

The following table describes the fields of the approval request list:

Field	Description
Title	Short description about the approval request.
Mini Program name	Mini program name.
Category	The category that the approval request belongs to. Valid values are:

- Member requests
- Launch/Publishing
- Removal
- Feature activation
- Version
- The field is required when the value of Category is Launch/Publishing.
- Applicant
- The person who submits the approval request.
- Created time
- The time when the approval request is created. The format is yyyy-MM-dd HH:mm.
- Finish time
- The time when the approval request is processed. The format is yyyy-MM-dd HH:mm.
- Status
- Status of the approval request. Valid values are:
- In review
- Approved
- Rejected
- Withdrawn

Table 1. Fields of the approval request list

Authorization

2022-07-07 17:08

The Authorization functionality is available for workspace admins. With this functionality, you can check the authorization information and revoke the authorization.

Features

You can benefit from the following features:

- Check the authorization information in the list

You can check the authorization information in the list that includes:

- Authorized ISV Name: The authorized ISV name.
- Authorized Mini Program: The authorized mini program name.
- Mini Program ID: The authorized mini program ID.
- Status: The authorization status that can be Authorized , Deauthorized, InReview and Rejected.
- Action: The action of viewing the authorization details.

Note: For ISVs who would like to apply for authorization, see how to [apply for authorization](#).

- Revoke the authorization

Workspace admin can revoke the authorization for the authorized mini programs.

- Apply for authorization

ISV can apply for the authorization for the mini programs.

Avatar {#avatar}

Last updated: 2022-07-03

Path: miniprogram_gcash

Avatar

2022-07-03 18:44

You can use the avatar component to display avatars.

Sample code

See the sample codes in different languages:

.js

copy

```
{  
  "defaultTitle": "Avatar",  
  "usingComponents": {  
    "avatar": "mini-ali-ui/es/avatar/index"  
  }  
}
```

.axml

copy

```
<view>
  <!--normal avatar-->
  <avatar src="xxxx" shape="standard"/>
  <!--avatar with username and short description-->
  <avatar src="xxxx" size="lg" name="username" desc="abstract
description" shape="standard" />
</view>
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || className | String | Customized class. || src | String | Source of the avatar image. The default value is Default avatar with blue background. || size | String | Avatar size. Valid values are:

- lg
- md
- sm
- xs

The default value is md. || shape | String | Avatar shape. Valid values are:

- standard
- circle
- square

The default value is circle. || name | String | Username. || desc | String | Short description about the user. || onError | EventHandle | The event that is triggered when the avatar is failed to be loaded. The default value is (e: Object) => void. |

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/extended-component_guide_avatar

Badge {#badge}

Last updated: 2022-07-03

Path: miniprogram_gcash

Badge

2022-07-03 18:44

Red dot, number or text. Used to tell users there are some updates.

||||| --- | --- | --- | --- || **Property** | **Description** | **Type** | **Default** | **Required** || text | Number or text to be displayed. | String/Number || No || dot | Show a red dot instead of number. | Boolean || No || overflowCount | Top number to be shown, “+” shown for more. | Number | 99 | No |

Slots

||||---|---|| **slotName** | **Description** || inner | Optional, when badge is wrapper, it is used to render the internal region. |

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "list": "mini-antui/es/list/index",
    "list-item": "mini-antui/es/list/list-item/index",
    "badge": "mini-antui/es/badge/index"
  }
}
```

copy

```
<view>
  <list>
    <block a:for="{{items}}>
      <list-item
        arrow="{{true}}"
        index="{{index}}"
        key="items-{{index}}"
        last="{{index === (items.length - 1)}}"
      >
        <view>
          <badge a:if="{{item.isWrap}}" text="{{item.text}}" dot="{{item.dot}}>
            <view slot="inner" style="height: 26px; width: 26px;
background-color: #ddd;"></view>
          </badge>
          <text style="margin-left: {{item.isWrap ? '12px' : '0'}}">{{item.intro}}</text>
        </view>
        <view slot="extra">
          <badge a:if="{{item.isWrap}}" text="{{item.text}}" dot="{{item.dot}}>
            <view>
              <list-item>
                </list-item>
              </block>
            </list>
          </view>
        </view>
      </list-item>
    </block>
  </list>
</view>
```

copy

```

Page({
  data: {
    items: [\n      {\n        dot: true,\n        text: '',\n        isWrap: true,\n        intro: 'Dot Badge',\n      },\n      {\n        dot: false,\n        text: 1,\n        isWrap: true,\n        intro: 'Text Badge',\n      },\n      {\n        dot: false,\n        text: 99,\n        isWrap: false,\n        intro: 'Number Badge',\n      },\n      {\n        dot: false,\n        text: 100,\n        overflowCount: 99,\n        isWrap: false,\n        intro: 'OverflowCount',\n      },\n      {\n        dot: false,\n        text: 'new',\n        isWrap: false,\n        intro: 'Text Badge',\n      },\n    ],\n  },

Bluetooth API Error Code Table {#bluetooth-api-error-code-table}

Last updated: 2021-05-09

Path: miniprogram_gcash

Bluetooth API Error Code Table

2021-05-09 18:43

The table below lists the errors for bluetooth APIs. You can find error codes, error messages and solutions to resolve the errors.

		--- --- ---	Error Code	Error Message	Solutions
		10000 The Bluetooth adapter is not initialized.	Call API my.openBluetoothAdapter for initialization.	10001 The Bluetooth adapter is not available.	Check whether BLE is supported in your device and enable the function if it's supported.
		10002 Device not found	Check the device ID and make sure peripheral broadcast of the target device is enabled.	10003 Connection failed	Check the device ID and make sure peripheral broadcast of the target device is enabled.
		10004 Service not found	Check the device ID and make sure the service is available for target devices.	10005 Characteristic not found	Use a correct characteristic ID and make sure the characteristic is enabled for the service.
		10006 Connection lost	Disconnect and try again.	10007 Characteristic not supported	Check the read, write and notify functions of the current characteristic.
		10008 System error	An unknown system error.	10009 BLE is not supported for Android systems with versions lower than 4.3.	Remind users it's not supported in the current android system version.
		10010 Descriptor not found	Use a correct service ID and characteristic ID.	10011 Invalid device ID	Use a correct device ID.
		10012 Invalid service ID	Use a correct service ID.	10013 Invalid characteristic ID	Use a correct characteristic ID.
		10014 Invalid data	Use valid data.	10015 Timeout	Try again.
		10016 Parameters not enough	Check the parameters and try again.	10017 Failed to write characteristic	Make sure writing is supported for peripheral characteristic. Don't disconnect.
		10018 Failed to read characteristic	Make sure reading is supported for peripheral characteristic. Don't disconnect.

Bluetooth API FAQ {#bluetooth-api-faq}

Last updated: 2022-07-03

Path: miniprogram_gcash

Bluetooth API FAQ

2022-07-03 18:44

Q: Does the API call of `my. WriteBLECharacteristicValue` return an empty value?

A: No. Calling this API returns the value of what you write.

Q: Why is listening not supported with the API call of `my.onBLECharacteristicValueChange`? Do I have to write before I can listen?

A: Yes. To call this API, you first need to write before you can listen. In order to prevent multiple callbacks of an event caused by multiple registered event listeners, it is recommended to call off method to listen to an event and close the previous event listener, before you call on method.

Q: Why do I get an error code `10014` with the API call of `my. Why writeBLECharacteristicValue`?

A: The error code `10014` means the data you send are either empty or incorrectly formatted. It is recommended to check for errors in the written data or HEX conversion.

Q: Can I use the hexadecimal array to write characteristic value with the API `my writeBLECharacteristicValue` ?

A: No. The characteristic values you write are hexadecimal strings, which are limited to 20 bytes.

Q: What is the `deviceId` format for Android and iOS devices?

A:

- An Android device gets the MAC address for bluetooth, such as:
`11:22:33:44:55:66`.
- An iOS device gets the UUID of Bluetooth, such as: `00000000-0000-0000-0000-000000000000`.

Q: Why can't I search for any device with the API call of `my.startBluetoothDevicesDiscovery`?

A: Please make sure that the device is discoverable. If the API is passed to Services, make sure that the discoverable content of the device contains the UUID of the service.

Q: If GPS positioning is not enabled when calling an bluetooth API, some devices will report an error message that bluetooth can't be connected as positioning service is not enabled.

A: The bluetooth function of the mini program relies on GPS positioning, as about 20% mobile phones rely on GPS to enable bluetooth. It is recommended to guide users to turn on the GPS positioning service in order to be connected with bluetooth.

Q: How do I resolve device connection failure?

A: Please make sure the correct deviceId is transmitted with strong signals. If the signal is weak, a device connection failure may occur.

Q: How to resolve write/read data failure?

A: Make sure to check the following settings:

- DeviceId, serviceId, and characteristicId are transmitted in the correct format.
- DeviceId is connected (You can call the API `my.OnBLEConnectionStateChanged` to listen to the connection state changes; Call the API `my.GetConnectedBluetoothDevices` to check for devices that are connected.
- Write a method in the connected state.
- Check and make sure characteristicId belongs to this Service.
- This characteristic supports write/read.

Q: How do I receive data notifications?

A:

- Make sure to call the API `my.notifyBLECharacteristicValueChange` with correct parameters.
- Notify or indicate features are supported in the transmitted characteristicID.
- Make sure the hardware is notified.
- Pay attention to the basic flow sequence, i.e. call the API `notifyBLECharacteristicValueChange` once you're connected.

Q: Why are event callbacks called multiple times?

A: The same event was listened due to multiple anonymous function registrations. It is recommended to call off method to listen for an event and close the previous event listener, before you call on method.

Bluetooth API Overview {#bluetooth-api-overview}

Last updated: 2021-05-09

Path: miniprogram_gcash

Bluetooth API Overview

2021-05-09 18:43

Before you get started, you can see the system requirement as a prerequisite and then see the process flow on how the bluetooth APIs work. You can then find an overview of all the bluetooth APIs and a sample of code snippet. In addition, you can refer to the FAQ and error code table for more details.

System Requirement

|||| --- | --- || **Bluetooth Type** | **System Requirement** || Bluetooth Low Energy (BLE) |
 Android: 5.0 and upper versions
 iOS: no requirements |

Process Flow

The following diagram illustrates how the bluetooth function is enabled with APIs. You can see the details on how each API works.

BLE

Traditional Bluetooth

API List

|||| --- | --- | --- || **Bluetooth Type** | **API** | **Description** || BLE | my.connectBLEDevice | Connect to low energy bluetooth devices. || BLE | my.disconnectBLEDevice | Disconnect to low energy bluetooth devices. || BLE | my.getBLEDeviceCharacteristics | Get the characteristics of low energy bluetooth devices. || BLE | my.getBLEDeviceServices | Get all the low energy bluetooth devices that are discovered, including the connected devices. || BLE | my.notifyBLECharacteristicValueChange | Enable the function to notify changes to the characteristic value. || BLE | my.offBLECharacteristicValueChange | Disable the function to notify changes to the characteristic value. || BLE | my.offBLEConnectionStateChanged | Disable the event listener for the connection status. || BLE | my.onBLECharacteristicValueChange | Enable the event listener for changes to the characteristic value. || BLE | my.onBLEConnectionStateChanged | Enable the event listener for changes to the connection status, such as device lost and device disconnected. || BLE | my.readBLECharacteristicValue | Read the characteristic value. ||

BLE | my.writeBLECharacteristicValue | Write data to the characteristic value. || Bluetooth | my.openBluetoothAdapter | Use this API to initialize the Bluetooth module in the mini program. || Bluetooth | my.closeBluetoothAdapter | Use this API to close the Bluetooth module in the mini program. || Bluetooth | my.getBluetoothAdapterState | Use this API to check the Bluetooth adapter status in the mini program. || Bluetooth | my.startBluetoothDevicesDiscovery | Use this API to start discovering bluetooth devices. || Bluetooth | my.stopBluetoothDevicesDiscovery | Use this API to stop discovering bluetooth devices. || Bluetooth | my.getBluetoothDevices | Use this API to get all the bluetooth devices that are discovered, including those that are connected to the current device. || Bluetooth | my.getConnectedBluetoothDevices | Use this API to get the bluetooth devices that are connected. || Bluetooth | my.onBluetoothDeviceFound | Use this API when a new Bluetooth device is found. || Bluetooth | my.offBluetoothDeviceFound | Use this API to remove the bluetooth devices that are found. || Bluetooth | my.onBluetoothAdapterStateChange | Use this API to monitor the bluetooth adapter state changes. || Bluetooth | my.offBluetoothAdapterStateChange | Use this API to remove the bluetooth adapter with a state change. |

Bluetooth API Overview

2022-07-03 18:44

Before you get started, you can see the system requirement as a prerequisite and then see the process flow on how the bluetooth APIs work. You can then find an overview of all the bluetooth APIs and a sample of code snippet. In addition, you can refer to the FAQ and error code table for more details.

System Requirement

|||| --- | --- || **Bluetooth Type** | **System Requirement** || Bluetooth Low Energy (BLE) |
Android: 5.0 and upper versions
iOS: no requirements |

Process Flow

The following diagram illustrates how the bluetooth function is enabled with APIs. You can see the details on how each API works.

BLE

Traditional Bluetooth

API List

||||| --- | --- | --- || **Bluetooth Type** | **API** | **Description** || BLE | my.connectBLEDevice | Connect to low energy bluetooth devices. || BLE | my.disconnectBLEDevice | Disconnect to low energy bluetooth devices. || BLE | my.getBLEDeviceCharacteristics | Get the characteristics of low energy bluetooth devices. || BLE | my.getBLEDeviceServices | Get all the low energy bluetooth devices that are discovered, including the connected devices. || BLE | my.notifyBLECharacteristicValueChange | Enable the function to notify changes to the characteristic value. || BLE | my.offBLECharacteristicValueChange | Disable the function to notify changes to the characteristic value. || BLE | my.offBLEConnectionStateChanged | Disable the event listener for the connection status. || BLE | my.onBLECharacteristicValueChange | Enable the event listener for changes to the characteristic value. || BLE | my.onBLEConnectionStateChanged | Enable the event listener for changes to the connection status, such as device lost and device disconnected. || BLE | my.readBLECharacteristicValue | Read the characteristic value. || BLE | my.writeBLECharacteristicValue | Write data to the characteristic value. || Bluetooth | my.openBluetoothAdapter | Use this API to initialize the Bluetooth module in the mini program. || Bluetooth | my.closeBluetoothAdapter | Use this API to close the Bluetooth module in the mini program. || Bluetooth | my.getBluetoothAdapterState | Use this API to check the Bluetooth adapter status in the mini program. || Bluetooth | my.startBluetoothDevicesDiscovery | Use this API to start discovering bluetooth devices. || Bluetooth | my.stopBluetoothDevicesDiscovery | Use this API to stop discovering bluetooth devices. || Bluetooth | my.getBluetoothDevices | Use this API to get all the bluetooth devices that are discovered, including those that are connected to the current device. || Bluetooth | my.getConnectedBluetoothDevices | Use this API to get the bluetooth devices that are connected. || Bluetooth | my.onBluetoothDeviceFound | Use this API when a new Bluetooth device is found. || Bluetooth | my.offBluetoothDeviceFound | Use this API to remove the bluetooth devices that are found. || Bluetooth | my.onBluetoothAdapterStateChange | Use this API to monitor the bluetooth adapter state changes. || Bluetooth | my.offBluetoothAdapterStateChange | Use this API to remove the bluetooth adapter with a state change. |

Button {#button}

Last updated: 2022-07-03

Path: miniprogram_gcash

Button

2022-07-03 18:44

You can use the button component to allow users to perform actions or make choices. The component is often used to submit forms, redirect users to another interface, or guide users to next steps. The usage is consistent with the [basic button component](#), but more styles are added in the extended button component.

Sample code

See the sample codes in different languages:

.json

copy

```
{  
  "defaultTitle": "Button",  
  "usingComponents": {  
    "button": "mini-ali-ui/es/button/index",  
    "radio": "mini-ali-ui/es/am-radio/index",  
    "checkbox": "mini-ali-ui/es/am-checkbox/index"  
  }  
}
```

.axml

copy

```
<view class="container">  
  <button onTap="onTest" showLoading="{{showLoading}}" dataName="{{dataName}}"  
    type="{{type}}" subtitle="{{subtitle}}" disabled="{{disabled}}"  
    shape="{{shape}}" capsuleSize="{{capsuleSize}}"  
    capsuleMinWidth="{{capsuleMinWidth}}>  
    {{title}}  
  </button>  
  <view>main title</view>  
  <input value="{{title}}" onInput="titleChange"/>  
  <view>subtitle</view>  
  <input value="{{subtitle}}" onInput="subtitleChange"/>  
  <view>button type</view>  
  <radio-group class="radio-group" onChange="typeChange" name="type">  
    <label class="radio" a:for="{{types}}" key="label-{{index}}>  
      <radio value="{{item.name}}" checked="{{item.checked}}"/>  
      <text class="radio-text">{{item.value}}</text>  
    </label>  
  </radio-group>  
  <view>shape</view>  
  <radio-group class="radio-group" onChange="shapeChange" name="shape">  
    <label class="radio" a:for="{{shapes}}" key="label-{{index}}>  
      <radio value="{{item.name}}" checked="{{item.checked}}"/>
```

```

<text class="radio-text">{{item.value}}</text>
</label>
</radio-group>
<view>capsule button size</view>
<radio-group class="radio-group" onChange="sizeChange" name="size">

    this.setData({
        subtitle: e.detail.value,
    });
},
onDisableChange(e) {
    this.setData({
        disabled: e.detail.value,
    });
},
onMinWidthChange(e) {
    this.setData({
        capsuleMinWidth: e.detail.value,
    });
},
```

```

    onTap() {
      // e.target.dataset.name
    },
    onLoadingChange(e) {
      this.setData({
        showLoading: e.detail.value,
      });
    },
  );
}

```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || type | String | Button style. Valid values are:

- default
- primary
- ghost
- warn
- warn-ghost
- text
- light

The default value is default. || subtitle | String | Subtitle. || shape | String | Button shape. Valid values are:

- default
- capsule

The default value is default. || capsuleSize | String | Capsule button size. Valid values are:

- large
- medium
- small

The default value is medium. || capsuleMinWidth | Boolean | An indicator of whether to use the minimum width for the capsule button. The default value is false. || disabled | Boolean | An indicator of whether to disable the button. The default value is false. || showLoading | Boolean | An indicator of whether to display the loading icon on the button. The default value is false. || hover-class | String | Style class after the button is pressed. The default class name is button-hover and the style is {background-color: rgba(0, 0, 0, 0.1); opacity: 0.7;}. If the value is none, no style changes occur when users press the button. || hover-start-time | Number | The duration in milliseconds between two moments. One moment is the time when users tap the button and the other is the time when the button changes to the tapped status. The default value is 20. || hover-stay-time | Number | The duration in milliseconds that the tapped status lasts after users tap the button. The default value is 70. || hover-stop-propagation | Boolean | An indicator of whether to prevent the tapped status from the parent element of the current element. The default value is false. || form-type | String | The button type that is used in the form component. Valid values are:

- submit
- reset

When users tap the button, the onSubmit event or the onReset event is triggered. || open-type | String | Open capability, such as the payment capability. || scope | String | Authorization scope, which is valid when the value of *open-type* is getAuthorize. ||

onTap | EventHandle | The event that is triggered when users tap the button. || app-parameter | String | Parameters that are transmitted to the opened app, which are valid when the value of *open-type* is `launchApp`. |

Calendar

2022-07-03 18:44

Calendar

Property	Description	Type	Default	Required	type
Selection type <code>single</code> : Single date range: Date range.	String single No	tagData			Tag data, including date, tag, disable or not, tag color tagColor. The tagColor includes 1.#f5a911, 2.#e8541e, 3.#07a89b 4.#108ee9 and 5.#b5b5b5. Array<date, tag, tagColor>
No	onSelect	Select range callback. ([startDate, endDate]) => void	No	onMonthChange	Callback on clicking month change, including two parameters currentMonth (change to next month) and prevMonth (change to previous month). (currentMonth, prevMonth) => void
No	onSelectHasDisableDate				Selected range includes unusable date. (currentMonth, prevMonth) => void
					No

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "calendar": "mini-antui/es/calendar/index"
  }
}
```

copy

```
<view>
  <calendar
    type="single"
```

```

        tagData="{{tagData}}"
        onSelect="handleSelect" />
</view>

copy

Page({
  data: {
    tagData: [
      { date: '2018-05-14', tag: 'Returning mortgage', tagColor: 5 },
      { date: '2018-05-28', tag: 'Provident fund', tagColor: 2 },
    ],
  },
  handleSelect() {},
  onMonthChange() {},
});

```

Call an API via adding a signature {#call-an-api-via-adding-a-signature}

Last updated: 2022-07-03

Path: miniprogram_gcash

Call an API via adding a signature

2022-07-03 18:44

Before calling an API, signing a request is needed. After sending the request and obtaining the response, you need to validate the response signature accordingly.

Sign a request

Procedures

1. Obtain your private key, represented by `privateKey`, which is used to sign a request.
2. Construct the content to be signed (`Content_To_Be_Signed`).
3. Calculate and generate the signature.
4. Add the generated signature to the request header.

For details of each step, see the following examples.

Example

1. Obtain your private key to sign the request

Get your private key ready, which is used to generate the signature later.

2. Construct the content to be signed

For example, a request has the following properties:

- **HTTP_URI** : for example, /api/v2/payments/pay
- **Client-Id** : TEST_5X00000000000000
- **Request-Time** : 2019-05-28T12:12:12+08:00
- **HTTP_BODY** : the body looks like the following format.

copy

```
{
  "order": {
    "orderId": "OrderID_0101010101",
    "orderDescription": "sample_order",
    "orderAmount": {
      "value": "100",
      "currency": "JPY"
    }
  },
  "paymentAmount": {
    "value": "100",
    "currency": "JPY"
  },
  "paymentFactor": {
    "isInStorePayment": "true"
  }
}
```

By complying with the Syntax of Content To Be Signed, the content to be signed (Content_To_Be_Signed) is created as follows:

copy

```
POST /api/v2/payments/pay
TEST_5X00000000000000.2019-05-28T12:12:12+08:00.{
  "order": {
    "orderId": "OrderID_0101010101",
    "orderDescription": "sample_order",
    "orderAmount": {
      "value": "100",
      "currency": "JPY"
    }
  },
  "paymentAmount": {
```

```

        "value": "100",
        "currency": "JPY"
    },
    "paymentFactor": {
        "isInStorePayment": "true"
    }
}

```

Syntax of Content_To_Be_Signed

copy

```
<HTTP_METHOD> <HTTP_URI>
<Client-Id>.<Request-Time>.<HTTP_BODY>
```

- **HTTP_METHOD** : POST
- **HTTP_URI** : For example, if the HTTP URL is <https://example.com/api/v2/payments/pay>, this property is /api/v2/payments/pay.
- **Client-Id** : is used to identify a client, and is associated with the keys that are used for signature and. You can get this field from the request header.
- **Request-Time**: Specifies the time when a request is sent, as defined by [ISO8601](#). Note: This field must be accurate to milliseconds. For example, 2019-05-28T12:12:12+08:00 . You can get this field from the request header.
- **HTTP_BODY** : the data body of a request.

3. Calculate and generate the signature

Use the sha256withrsa method that involves the proper algorithm and private key to calculate and generate the signature.

copy

```
generatedSignature=base64UrlEncode(sha256withrsa(<Content_To_Be_Signed>
<privateKey>)
```

- **Content_To_Be_Signed**: the content to be signed that is obtained in step 2.
- **privateKey** : the private key value that is obtained in step 1.
- **sha256withrsa** : the algorithm to use, RSA256.

For example, the generated signature generatedSignature looks as follows:

copy

```
KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UKFPMip09n%2FkYKPhEIII%2Fki2rYY2lPtuKV(
2FjzRpohDbr0d8zYriiukpGAxBQDIVbatGI7WY0cc9YVQwdCR6R0uRQvr%2FD1AfdhHd6w;
w10W7Ti93LTd0tcyEWQYd2S7c3A73sH0JNYl8DC1PjasibozZ%2FADgb70NsqHo%2B8fKH:
TGIRBQsvfgICnJhh%2BzXV8AQoecJBTrv6p%xxxx
```

4. Add the generated signature to the request header

a. Assemble a signature string as the following syntax.

copy

```
'Signature: algorithm=<algorithm>, keyVersion=<key-version>,
signature=<generatedSignature>'
```

- `algorithm`, `keyVersion`: see the header of the [Message structure](#) chapter.
- `generatedSignature`: the signature that is generated in step 3.

For example:

copy

```
'Signature: algorithm=rsa256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2i'
```

b. Add the signature string to the request header.

For example:

copy

```
-H 'Signature: algorithm=rsa256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2i'
```

Send a request

Construct a request by adding the `Client-Id`, `Request-Time`, and `Signature` fields to the request header. After a request is constructed, you can use common tools, like cURL or Postman to send the request. In the following example, cURL is used.

copy

```
curl -X POST \
  https://example.com/api/v2/payments/pay \
  -H 'Content-Type: application/json' \
  -H 'Client-Id: TEST_5X00000000000000' \
  -H 'Request-Time: 2019-05-28T12:12:12+08:00' \
  -H 'Signature: algorithm=rsa256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2i'
\
-d '{
  "order": {
    "orderId": "OrderID_0101010101",
    "orderDescription": "sample_order",
    "orderAmount": {
      "value": "100",
      "currency": "JPY"
    }
  },
  "paymentAmount": {
    "value": "100",
    "currency": "JPY"
  }
}'
```

```

    "currency":"JPY"
},
"paymentFactor": {
    "isInStorePayment": "true"
}
}'

```

Handle a response

After you receive a response, you need to validate the signature of the response. A response consists of response headers and the response body. For example:

- The response header sample

copy

```

Client-Id: 5X00000000000000
Response-Time: 2019-05-28T12:12:14+08:00
Signature: algorithm=RSA256, keyVersion=0,
signature=p9T2hXxIjek0U0Lw3fwlthNsV6ATaioIvu8X1uFx8a9tE87d2XEhqylnf0Kj:
GwwlDS3tsSenwnL0Ha6BsXbJvUHRC5qcVlNy50q%2FpNqx%2BKdwbw4eY7tZBDQhMKoaM\ 
Trace-Id: 0ba604b41558615600801371953814.0

```

- The response body sample

copy

```

{
"result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
},
"paymentTime": "2019-05-28T12:12:13+08:00",
"paymentId": "1234567"
}

```

Validate a signature

1. Obtain the platform public key.
2. Construct the content to be validated (Content_To_Be_Validated).
3. Get the signature from the response header.
4. Validate the signature.

For details of each step, see the following examples.

Example

1. Obtain the platform public key

The Client-Id and KeyVersion properties can be obtained from the response header. Merchants send these properties to the wallet, based on which, the wallet returns the public key to the merchant.

2. Construct the content to be validated

Given the response body sample above, by complying with the Syntax of Content To Be Validated, construct the content to be validated (Content_To_Be_Validated) as follows:

copy

```
POST /api/v2/payments/pay
TEST_5X00000000000000.2019-05-28T12:12:14+08:00.{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "paymentTime": "2019-05-28T12:12:13+08:00",
  "paymentId": "1234567"
}
```

Syntax of Content_To_Be_Validated

copy

```
<HTTP_METHOD> <HTTP_URI>
<Client-Id>. <Response-Time>. <HTTP_BODY>
```

- Client-Id : identifies a client. You can get this field from the response header. For example
- TEST_5X00000000000000
- Response-Time: Indicates the time when a response is returned, as defined by ISO8601. Note: This field must be accurate to milliseconds. You can get this field from the response header.
- HTTP_BODY : Indicates the data body of the response.

3. Get the signature from the response header

The target signature string (target_signature) is extracted from Signature header of the response. For details about the response header, see the Message structure chapter.

copy

```
Signature: algorithm=RSA256, keyVersion=0, signature=
<target_signature>
```

4. Validate the signature

Use the `sha256withrsa_verify` method to validate the signature of a response.

Syntax of the `sha256withrsa_verify` method:

copy

```
sha256withrsa_verify(base64UrlDecode(<target_signature>),  
<Content_To_Be_Validated>, <serverPublicKey>)
```

- `target_signature` : the signature extracted from the response header, which is obtained from step 3.
- `Content_To_Be_Validated`: the content to be validated that is created from step 2.
- `serverPublicKey` : the platform public key that is obtained from step 1.

Call an API via adding a signature

2021-05-09 18:43

Before calling an API, signing a request is needed. After sending the request and obtaining the response, need to validate the response signature accordingly.

Sign a request

Procedure

1. Obtain your private key, represented by `privateKey`, which is used to sign a request.
2. Construct the content to be signed (`Content_To_Be_Signed`).

3. Calculate and generate the signature.
4. Add the generated signature to the request header.

For details of each step, see the following examples.

Example

1. Obtain your private key to sign the request

Get your private key ready, which is used to generate the signature later.

2. Construct the content to be signed

For example, a request has the following properties:

- **HTTP_URI** : for example, /api/v2/payments/pay
- **Client-Id** : TEST_5X00000000000000
- **Request-Time** : 2019-05-28T12:12:12+08:00
- **HTTP_BODY** : the body looks like the following format.

copy

```
{
  "order": {
    "orderId": "OrderID_0101010101",
    "orderDescription": "sample_order",
    "orderAmount": {
      "value": "100",
      "currency": "JPY"
    }
  },
  "paymentAmount": {
    "value": "100",
    "currency": "JPY"
  },
  "paymentFactor": {
    "isInStorePayment": "true"
  }
}
```

By complying with the [Syntax of Content To Be Signed](#), the content to be signed (Content_To_Be_Signed) is created as follows:

copy

```
POST /api/v2/payments/pay
TEST_5X00000000000000.2019-05-28T12:12:12+08:00.{
  "order": {
    "orderId": "OrderID_0101010101",
    "orderDescription": "sample_order",
    "orderAmount": {
```

```

        "value":"100",
        "currency":"JPY"
    }
},
"paymentAmount": {
    "value":"100",
    "currency":"JPY"
},
"paymentFactor": {
    "isInStorePayment": "true"
}
}

```

3. Calculate and generate the signature

Use the sha256withrsa method that involve the proper algorithm and private key to calculate and generate the signature.

copy

```
generatedSignature=base64UrlEncode(sha256withrsa(<Content_To_Be_Signed:<privateKey>))
```

- **Content_To_Be_Signed:** the content to be signed that is obtained in step 2.
- **privateKey :** the private key value that is obtained in step 1.
- **sha256withrsa :** the algorithm to use, RSA256.

For example, the generated signature generatedSignature looks as follows:

copy

```
KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2rYY2lPtuKV%2FjzRphoDbr0d8zYriukpGAxBQDIVbatGI7WY0cc9YVQwdCR6R0uRQvr%2FD1AfdhHd6w%w10W7Ti93LTd0tcyEWQYd2S7c3A73sH0JNYl8DC1PjasibozZ%2FADgb70NsqHo%2B8fKH%TGIRBQsvfgICnJhh%2BzXV8AQoecJBTrv6p%xxxx
```

4. Add the generated signature to the request header

a. Assemble a signature string as the following syntax.

copy

```
'Signature: algorithm=<algorithm>, keyVersion=<key-version>,  
signature=<generatedSignature>'
```

- **algorithm ,keyVersion :** see the header of the [Message structure](#) chapter.
- **generatedSignature :** the signature that is generated in step 3.

For example:

copy

```
'Signature: algorithm=RSA256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2I
```

b. Add the signature string to the request header.

For example:

copy

```
-H 'Signature: algorithm=RSA256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2I
```

Syntax of Content_To_Be_Signed

copy

```
<HTTP_METHOD> <HTTP_URI>
<Client-Id>.<Request-Time>.<HTTP_BODY>
```

- **HTTP_METHOD** : POST
- **HTTP_URI** : For example, if the HTTP URL is <https://example.com/api/v2/payments/pay>, this property is /api/v2/payments/pay.
- **Client-Id** : is used to identify a client, and is associated with the keys that are used for signature and encryption. You can get this field from the request header.
- **Request-Time**: Specifies the time when a request is sent, as defined by [RFC3339](#). Note: This field must be accurate to milliseconds. For example, 2019-05-28T12:12:12+08:00 . You can get this field from the request header.
- **HTTP_BODY** : the data body of a request.

Send a request

Construct a request by adding the Client-Id, Request-Time, and Signature fields to the request header. After a request is constructed, you can use common tools, like cURL or Postman to send the request. In the following example, cURL is used.

copy

```
curl -X POST \
  https://example.com/api/v2/payments/pay \
  -H 'Content-Type: application/json' \
  -H 'Client-Id: TEST_5X00000000000000' \
  -H 'Request-Time: 2019-05-28T12:12:12+08:00' \
  -H 'Signature: algorithm=RSA256, keyVersion=0,
signature=KrwDE9tAPJYBb4cUZU6ALJxGIZgwDXn5UkFPMip09n%2FkYKPhEIII%2Fki2I'
\
-d '{
  "order": {
    "orderId": "OrderID_01010101",
    "orderDescription": "sample_order",
```

```

    "orderAmount": {
        "value": "100",
        "currency": "JPY"
    },
    "paymentAmount": {
        "value": "100",
        "currency": "JPY"
    },
    "paymentFactor": {
        "isInStorePayment": "true"
    }
}

```

Handle a response

After you receive a response, you need to validate the signature of the response. A response consists of response headers and response body. For example:

- The response header sample

copy

```

Client-Id: 5X00000000000000
Response-Time: 2019-05-28T12:12:14+08:00
Signature: algorithm=RSA256, keyVersion=0,
signature=p9T2hXxIjek0U0Lw3fwlthNsV6ATaioIvu8X1uFx8a9tE87d2XEhqylnf0Kj:
GwwlDS3tsSenwnL0Ha6BsXbJvUHRC5qcVlNy50q%2FpNqx2%2BKdwbw4eY7tZBDQhMKoaM\ 
Trace-Id: 0ba604b41558615600801371953814.0

```

- The response body sample

copy

```

{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "paymentTime": "2019-05-28T12:12:13+08:00",
  "paymentId": "1234567"
}

```

Validate a signature

1. Obtain the platform public key.
2. Construct the content to be validated (Content_To_Be_Validated).
3. Get the signature from the response header.

4. Validate the signature.

For details of each step, see the following examples.

Example

1. Obtain the platform public key

The Client-Id and KeyVersion properties can be obtained from the response header. Merchants send these properties to the wallet, based on which, the wallet returns the public key to the merchant.

2. Construct the content to be validated

Given the response body sample above, by complying with the Syntax of Content To Be Validated, construct the content to be validated (Content_To_Be_Validated) as follows:

copy

```
POST /api/v2/payments/pay
TEST_5X00000000000000.2019-05-28T12:12:14+08:00.{
  "result": {
    "resultCode": "SUCCESS",
    "resultStatus": "S",
    "resultMessage": "success"
  },
  "paymentTime": "2019-05-28T12:12:13+08:00",
  "paymentId": "1234567"
}
```

3. Get the signature from the response header

The target signature string (`target_signature`) is extracted from `Signature` header of the response. For details about the response header, see the Message structure chapter.

copy

```
Signature: algorithm=RSA256, keyVersion=0, signature=
<target_signature>
```

4. Validate the signature

Use the `sha256withrsa_verify` method to validate the signature of a response.

Syntax of the `sha256withrsa_verify` method:

copy

```
sha256withrsa_verify(base64UrlDecode(<target_signature>),
<Content_To_Be_Validated>, <serverPublicKey>)
```

- `target_signature` : the signature extracted from the response header, which is obtained from step 3.
- `Content_To_Be_Validated`: the content to be validated that is created from step 2.
- `serverPublicKey` : the platform public key that is obtained from step 1.

Syntax of Content_To_Be_Validated

copy

```
<HTTP_METHOD> <HTTP_URI>
<Client-Id>.<Response-Time>.<HTTP_BODY>
```

- `Client-Id` : identifies a client. You can get this field from the response header. For example `TEST_5X00000000000000`
- `Response-Time`: Indicates the time when a response is returned, as defined by [RFC3339](#). Note: This field must be accurate to milliseconds. You can get this field from the response header.
- `HTTP_BODY` : Indicates the data body of the response.

Capabilities {#capabilities}

Last updated: 2022-07-06

Path: miniprogram_gcash

Capabilities

2022-07-06 08:31

Capabilities are sets of JavaScript APIs (JSAPIs) and OpenAPIs that can work together to help merchants and ISV implement specific functions. For example, the payment capability is accomplished by the `my.tradePay` JSAPI and OpenAPIs such as `/{version}/payments/pay` and `/{version}/payments/notifyPayment`, where the version is v1 or v2.

Architecture overview

The calling process of JSAPIs and OpenAPIs is illustrated as below:

JSAPI

JSAPIs are available by default in the mini program container. You can call the existing JSAPIs from the mini program to use. When you call a JSAPI, it will interact between the wallet and the merchant or ISV backend server.

OpenAPI

ACL (Access Control List) OpenAPI standards are available. You can also use the standards of OpenAPIs and define the OpenAPIs. When you call an OpenAPI, it will interact between the wallet and the merchant or ISV backend server.

With a combination of JSAPIs and OpenAPIs, a set of capabilities can be defined. For example, you can see the following capabilities that are available by default:

- [User information capability](#)
- [Payment capability](#)
- For all OpenAPIs that support various capabilities, see [OpenAPIs for Merchants](#).

In addition, you can define your own features that are centrally managed in the workspace of the Mini Program Platform. You can select the JSAPIs that are available by default. For more information, see [Features](#).

Capabilities

2021-05-10 03:43

Introduction

Capabilities are sets of Java Script APIs (JSAPIs) and Open APIs that can work together to help users to complete specific tasks. For example, the payment capability is accomplished by the `my.tradePay` JSAPI and open APIs such as `/{version}/payments/pay` and `/{version}/payments/notifyPayment`, where the version is like v1 or v2

Architecture Overview

JSAPIs are available by default in the mini program container. You can use the existing JSAPIs which can be called from mini program, through wallet native apps to the merchant/ISV back-end server.

ACL Open API standards are available. You can also use the standards of Open APIs and define the Open APIs, which can be interacted in the back-end servers between the wallet and the merchant/ISV.

With a combination of JSAPIs and Open APIs, a set of capabilities can be defined. For example, you can see the following capabilities that are available by default:

- [User Information Capability](#)
- [Payment Capability](#)
- For all Open APIs that support various capabilities, see [Open APIs for Merchants](#)

In addition, you can define your own features that are centrally managed in the workspace of the Mini Program Platform. You can select the JSAPIs that are available by default. For more information, see [Features](#).

Card

2022-07-03 18:44

Card.

Property	Description	Type	Required
thumb	Card thumbnail address.	String	No
title	Card title.	String	Yes
subTitle	Card subtitle.	String	No
footer	Footer text.	String	No
footerImg	Footer image address.	String	No
onCardClick	Callback when the card is clicked.	(info: Object) => void	No
info	Used to transfer data to the outside when the card is clicked.	String	No

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "card": "mini-antui/es/card/index"
  }
}
```

copy

```
<card
  thumb="{{thumb}}"
  title="Card Title"
  subTitle="Subtitle is not required"
  onClick="onCardClick"
  footer="Description"
  footerImg="{{footerImg}}"
  info="Click the card"
/>
```

copy

```
Page({
  data: {
    thumb: 'https://img.example.com/example.png',
    footerImg: 'https://img.example.com/example.png',
  },
  onCardClick: function(ev) {
    my.showToast({
      content: ev.info,
    });
  }
});
```

Coding in the Editor

2022-07-03 18:44

Defines the features when you code in the editor.

Feature

In addition to the basic editing functions, the Mini Program Studio provides you with the following functions that are specific to Mini Program:

- Realtime preview: You can preview your codes in the local simulator.
- Autocomplete: Your codes are automatically completedly.
- Syntax prompt/suggestions: You can also get suggestions on the syntax.

For more information, see the demos below:

Collapse {#collapse}

Last updated: 2022-07-03

Path: miniprogram_gcash

Collapse

2022-07-03 18:44

Collapse/expand a content region.

- Group or hide complex region to keep the page clean and tidy.
- **Accordion mode** is a special collapse which allows opening just one content region.

Sample Code

copy

```
{  
    "defaultTitle": "Mini Program AntUI component library",  
    "usingComponents": {  
        "collapse": "mini-antui/es/collapse/index",  
        "collapse-item": "mini-antui/es/collapse/collapse-item/index"  
    }  
}
```

copy

```
<view>  
    <view class="demo-title">Basic usage</view>  
    <collapse  
        className="demo-collapse"  
        collapseKey="collapse1"  
        activeKey="{{['item-11', 'item-13']}}"  
        onChange="onChange"  
    >  
        <collapse-item header="Title 1" itemKey="item-11"  
        collapseKey="collapse1">  
            <view class="item-content content1">  
                <view>Content region</view>  
            </view>  
        </collapse-item>  
        <collapse-item header="Title 2" itemKey="item-12"  
        collapseKey="collapse1">  
            <view class="item-content content2">  
                <view>Content region</view>  
            </view>  
        </collapse-item>  
        <collapse-item header="Title 3" itemKey="item-13"  
        collapseKey="collapse1">  
            <view class="item-content content3">  
                <view>Content region</view>  
            </view>  
        </collapse-item>
```

```
</collapse>
<view class="demo-title">Accordion mode</view>
<collapse
  className="demo-collapse"
  collapseKey="collapse2"
  activeKey="{{{['item-21', 'item-23']}}}"
  onChange="onChange"
  accordion="{{true}}"
>
  <collapse-item header="Title 1" itemKey="item-21"
collapseKey="collapse2">
    <view class="item-content content1">
      <view>Content region</view>
    </view>
  </collapse-item>
  <collapse-item header="Title 2" itemKey="item-22"
collapseKey="collapse2">
    <view class="item-content content2">
      <view>Content region</view>
    </view>
  </collapse-item>
  <collapse-item header="Title 3" itemKey="item-23"
collapseKey="collapse2">
    <view class="item-content content3">
      <view>Content region</view>
    </view>
  </collapse-item>
</collapse>
</view>
```

copy

```
.item-content {
  padding: 14px 16px;
  font-size: 17px;
  color: #333;
  line-height: 24px;
}

.content1 {
  height: 200px;
}

.content2 {
  height: 50px;
}

.content3 {
  height: 100px;
}

.demo-title {
```

```

padding: 14px 16px;
color: #999;
}

.demo-collapse {
border-bottom: 1px solid #eee;
}

```

copy

```
Page({});
```

Attributes

	Property	Description	Type	Default
activeKey	Key of the active tab panel.	Array / String	None by default, or the first element by default in the accordion mode	onChange Callback for switching panel. (activeKeys: Array): void - accordion Accordion mode. Boolean false collapseKey Uniquely identifying the collapse and corresponding collapse-item. String false

Collapse-item

	Property	Description	Type	Default
itemKey	Corresponding activeKey.	String	Unique component identifier	header Header content of the panel. String - collapseKey Uniquely identifying the collapse and corresponding collapse-item. String false

When a page has multiple collapse components, the collapseKey attribute of the collapse and the corresponding collapse-item must be mandatory and equal. When a page has just one collapse component, the collapseKey is not mandatory.

Command-line interface {#command-line-interface}

Last updated: 2022-07-03

Path: miniprogram_gcash

Command-line interface

2022-07-03 18:44

The Command-line Interface (CLI) of the Alipay Plus Mini Program (APMP) is a tool that helps you to initialize, develop, and maintain your mini programs. It helps you to achieve cross-platform operation, preview on physical devices, initialize projects, and upload projects. Compared with IDE, CLI is more efficient as developers can use other code editing tools to improve mini program's development.

Overview

You can take an overview of CLI in the following table:

	Category	Description	Command	Description	Check versions
apmp -v	Check command-line descriptions	apmp -h	Workspace	Log in	apmp
login	log out	apmp logout	APP	Select the current app	apmp app select
				Initialize projects	apmp app create
				Preview apps	apmp app preview
				Upload apps	apmp app upload

Features

You can benefit from the following features:

- apmp login
- Check project information
- Set workspaces
- Select the current project
- Persistent login

Global installation

Sample code

copy

```
npm install apmp -g
```

Log in

Sample code

copy

```
# Input the username and password via command parameters
apmp login -u [username] -p [password] -w [workspaceId] -a [appId]

# Input the username and password via inquirer Q&A
apmp login
> username: [username]
```

```
> password: [password]
>
```

Parameters

Value	Name	Required
-u,--username	username	Yes
-p,--password	password	Yes
-w,--workspaceId	workspaceId	No
-a,--appId	appId	No

Log out

Log out, clear cache, and clear cookies.

Sample code

copy

```
apmp logout
```

Select the current app

Sample code

copy

```
apmp app select // use arrow key to move cursor
> app1:[app1]
> app2:[app2]
> app3:[app3]
```

Initialize projects

Sample code

copy

```
# Input app type and name via command parameters
apmp app create -t [mini-app] -n [appName]

# Input the app type and name via inquirer Q&A
apmp app create
- project type
> mini-app
- app name : [app name]
```

Parameters

||||||| --- | --- | --- | --- || **Name** | **Value** | **Required** | **Default Value** | **Remark** || -t, -type | type | No | None | Enum: mini-app || -n, --name | name | No | new-project | A new file will be generated according to the new project name. |

Preview apps

Sample code

copy

```
# Use the currently selected project
apmp app preview
```

Parameters

||||||| --- | --- | --- | --- || **Name** | **Value** | **Required** | **Default Value** | **Remark** || -a, -appId | appId | No | selectedCurrentAppId | You can obtain an appId in two ways:
 - Select an appId in the app list.
 - Obtain the currently selected appId If you have not selected an appId in the app list. || -w, --workspaceId | workspaceId | No | selectedCurrentWorkspaceId | You can obtain a workspaceId in two ways:
 - Select a workspaceId in the workspace list.
 - Obtain the currently selected workspaceId if you have not selected a workspaceId in the workspace list. || -p, -projectPath | projectPath | No | . | Use the current project path by default. |

Upload apps

Sample code

copy

```
# Use the currently selected project
apmp app upload
```

Parameters

||||||| --- | --- | --- | --- || **Name** | **Value** | **Required** | **Default Value** | **Remark** || -a, -appId | appId | No | selectedCurrentAppId | You can obtain an appId in two ways:
 - Select an appId in the app list.
 - Obtain the currently selected appId If you have not selected an appId in the app list. || -w, --workspaceId | workspaceId | No | selectedCurrentWorkspaceId | You can obtain a workspaceId in two ways:
 - Select a workspaceId in the workspace list.

- Obtain the currently selected workspaceId If you have not selected a workspaceId in the workspace list. || -p, --projectPath | projectPath | No | . | Use the current project path by default. || --nextVersion | nextVersion | No || specify upload version number. |

Compatibility {#compatibility}

Last updated: 2021-05-09

Path: miniprogram_gcash

Compatibility

2021-05-09 18:43

The component and API of Mini Program are improving and enriching, so some old sdk may not support the newly added abilities, so developers should handle the compatibility issue.

The `my.canIUse(String)` can help to detect whether the API, input parameter or returned value, component, property is supported in current version.

Handle Newly Added API

Following codes show how to handle compatibility issue for newly added API.

copy

```
if (my.getLocation) {
    my.getLocation();
} else {
    my.alert({
        title: 'Hint',
        content: 'The function is not supported, please upgrade App'
    });
}
```

Handle Newly Added Input Parameter of API

copy

```
if (my.canIUse('getLocation.object.type')) {
    // ...
} else {
```

```

        console.log('The parameter is not supported')
    }

```

Handle Newly Added Return Value of API

copy

```

if (my.canIUse('getSystemInfo.return.storage')) {
    // ...
} else {
    console.log('The returned value is not supported')
}

```

Handle Newly Added Property of Component

copy

```

Page({
  data: {
    canIUse: my.canIUse('button.open-type.share')
  }
})

```

copy

```

<button a:if="{{canIUse}}" open-type="share">Share</button>
<button a:else onTap="shareApp">Share Mini Program</button>

```

Condition Rendering {#condition-rendering}

Last updated: 2022-07-03

Path: miniprogram_gcash

Condition Rendering

2022-07-03 18:44

a:if

In an axml, a:if="{{condition}}" is used to tell whether a code block is to be rendered.

copy

```
<view a:if="{{condition}}> True </view>
```

Besides, a:elif and a:else can be used to add an else branch.

copy

```
<view a:if="{{length > 5}}> 1 </view>
<view a:elif="{{length > 2}}> 2 </view>
<view a:else> 3 </view>
```

block a:if

Because a:if is a control attribute, and can only be used in one component. For conditional rendering of multiple components at once, an **block** component can be used to contain those components, and add one a:if to control.

copy

```
<block a:if="{{true}}>
  <view> view1 </view>
  <view> view2 </view>
</block>
```

Note: <Block/> is not a component but just a packaging element. It does not render anything in the page but accepts control attribute only.

Compare a:if with hidden

- The template in a:if may contain data binding. So, when the a:if condition value changes, the framework has a process of local rendering which is used to ensure destroy or re-render in case of the change. In addition, when the initial render condition is false, the a:if does not trigger any render action, and starts local rendering when the condition turns true for the first time.
- The hidden controls show/hide, but the component is always rendered.

Generally, the a:if has a higher overhead when frequently toggled, while the hidden has a higher initial rendering overhead. As a result, hidden is better for frequent toggles. If the running conditions do not toggle much, a:if is preferred.

Constructor

2021-05-10 03:43

Constructor

Parameter Description

		Parameter	Type	Required	Description	data Object No
--- --- --- ---		Component internal status.	props Object No	Set default for incoming data.		
		onInit	Function No	Component lifecycle function, trigger on component creation.		
		deriveDataFromProps	Function No	Component lifecycle function, trigger on component creation and update.	didMount	Function No Component lifecycle function, trigger on component creation completion.
				didUpdate	Function No	Component lifecycle function, trigger on component update completion.
				didUnmount	Function No	Component lifecycle function, trigger on component deletion.
				mixins	Array No	Code reuse mechanism between components.
				methods	Object No	Component method, can be event response function or any customized method.

Sample Code

.js sample code:

copy

```
Component({
  mixins:[{ didMount() {}, }],
  data: {y:2},
  props:{x:1},
  didUpdate(prevProps,prevData){},
  didUnmount(),
  methods:{
    onMyClick(ev){
      my.alert({});
      this.props.onXX({ ...ev, e2:1});
    },
  },
})
```

Component Instance Attribute List

Parameter Description

||||| --- | --- | --- || **Property** | **Type** | **Description** || data | Object | Component internal data. || props | Object | Incoming component attribute. || is | String | Component path. || \$page | Object | Component page instance. || \$id | Number | Component id, can render value in component axml. |

Sample Code

js sample code:

copy

```
// /components/xx/index.js
Component({
  didMount(){
    this.$page.xxCom = this; // this operation can load the component
    instance to the belonging page instance
    console.log(this.is);
    console.log(this.$page);
    console.log(this.$id);
  }
});
```

axml sample code:

copy

```
<!-- /components/xx/index.axml component id can directly render value
in component axml -->
<view>{{$id}}</view>
```

json sample code:

copy

```
// /pages/index/index.json
{
  "usingComponents": {
    "xx": "/components/xx/index"
  }
}
```

js sample code:

copy

```
Page({
  onReady() {
    console.log(this.xxCom); // can access all loaded components
    loaded onto the current page
  },
})
```

When the component is rendered on the page, execute the didMount callback, and the console has the following output:

copy

```
/components/xx/index
{$viewId: 51, route: "pages/index/index"}
1
```

Component Instance Method List

--- --- ---	Method name	Parameter	Description	setData	Object	
Setting data triggers view rendering.	\$spliceData	Object	Setting data triggers view rendering.

Path: miniprogram_gcash

Container

2022-07-03 18:44

You can use the container component to make the style of all elements in the container more consistent, such as margins between elements.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "Container",
  "usingComponents": {
    "container": "mini-ali-ui/es/container/index",
    "title": "mini-ali-ui/es/title/index"
  }
}
```

.axml

copy

```
<view className="container">
  <container className="container-item">
```

```
        title="Customized title"
        thumb="https://img.alicdn.com/tafs/TB1Go8lh9R26e4jSZFEXXbwuXXa-84-
84.png"
        onActionTap="titleClick"
    >
        <view slot="operation" style="color: red;">is slot</view>
        <view class="item">The container component's own title properties.
If the icon property is not specified, you can insert a slot named
operation.</view>
    </container>

    <container className="container-item"
        title="Title with an arrow"
        icon="arrow"
        thumb="https://img.alicdn.com/tafs/TB1Q19sTNv1gK0jSZFFXXb0sXXa-112-
112.png"
        onActionTap="titleClick"
    >
        <view class="item">The container component's own title
properties</view>
    </container>

    <container className="container-item"
        title="Title with a close icon"
        icon="close"
        thumb="https://img.alicdn.com/tafs/TB1Go8lh9R26e4jSZFEXXbwuXXa-84-
84.png"
        onActionTap="titleClick"
    >
        <view class="item">The container component's own title
properties</view>
    </container>

    <container className="container-item"
        title="Title with a more icon"
        icon="more"
        thumb="https://img.alicdn.com/tafs/TB1Q19sTNv1gK0jSZFFXXb0sXXa-112-

    margin-bottom: 24rpx;
}

.footer {
    color: #333;
    margin-top: 24rpx;
}

.item {
    background: #eeeeee;
    text-align: center;
    height: 200rpx;
    padding-top: 20rpx;
}

.grid-item {
    background: #eeeeee;
    text-align: center;
}

```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || type | String | Layout type of container. Valid values are:

- **line**
- **onewithtwo**

The default value is **line**. When the value is **line**, all elements are equally divided into multiple rows or columns. || className | String | Customized style name. || title | String | Title name. The **title** component can be used if this property is specified. || thumb | String | URL of the icon in title. || icon | String | Icon on the right side of title. Valid values are:

- **arrow**
- **close**
- **more** || onActionTap | EventHandle | The event that is triggered when users tap the icon on the right of title. The default value is () => {}.

Parameters

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || thumb | String | No
 || URL of the coupon thumbnail image. || title | String | Yes | Coupon title. || subTitle |
 String | No | Coupon subtitle. || onCouponClick | Function | No | The event that is
 triggered when uses tap the coupon. || extra | Boolean | No | An indicator of whether to
 display the coupon extended information on the left. The default value is true. ||
 moreBtn | String | No | The clickable text. After clicking the text, users can view rules on
 how use the coupon in detail. The default value is More. || moreHide | Boolean | No | An
 indicator of whether to display the rules on how use the coupon in detail. The default
 value is true. || used | Boolean | No | An indicator of whether the coupon is valid. The
 default value is false. |

slots

|||| --- | --- || **Slot name** | **Description** || action | The slot on the right side of the coupon.
 After clicking the slot, users can use the coupon. || date | The slot for the expiry time of
 the coupon. || detail | The slot that is used to display rules on how to use the coupon in
 detail. || category | The slot on the left of the coupon, which is used to display the coupon
 type. |

Create mini programs

2022-07-07 17:08

This topic describes the steps of the task to create a mini program.

Procedures

To create a mini program, you can follow the corresponding steps as below:

Step 1: Log in to the console

Open the [Mini Program Platform portal](#) and click **CONSOLE** or **SIGN IN**.

Enter the email and password that have been registered. Click **Sign In** to enter Mini Program Console.

Step 2: Choose a workspace

Choose the workspace that you want to create a mini program.

Step 3: Enter information

Click **Mini Program** on the navigation panel to the left. Then, click **+ Create Mini Program** to create a new mini program.

Note: Only workspace admin can see the mini program source such as wallet, merchant, and Alipay+.

Choose the mini program type based on your needs. The platform supports two types of mini programs:

- **DSL(Default)**: Native mini programs
- **HTML5-based**: HTML 5 mini programs

For more information about how to create HTML 5 mini programs, see [How to transform an HTML 5 mobile app to an HTML 5 mini program](#).

After that, enter the mini program information according to requirements and prompt on the right panel and click **Create**.

Now you have completed creating a mini program.

Next steps

[Add mini program members](#)

[Upload mini programs](#)

[Configure mini programs](#)

[Release mini programs](#)

[Generate QR codes](#)

[Remove mini programs](#)

Data Binding {#data-binding}

Last updated: 2022-07-04

Path: miniprogram_gcash

Data Binding

2022-07-04 03:44

The dynamic data in AXML is bound with the data content in Page.

Simple Binding

The Mustache syntax is used to package variable with two pairs of braces ({{ }}). It can be used in various syntax scenarios.

Contents

copy

```
<view> {{ message }} </view>
```

copy

```
Page({
  data: {
    message: 'Hello!',
  },
});
```

Component Attribute

Component attributes need to be packaged with double quotation marks ("").

copy

```
<view id="item-{{id}}> </view>
```

copy

```
Page({
  data: {
    id: 0,
  },
});
```

Control Attribute

Control attributes need to be packaged with double quotation marks ("").

copy

```
<view a:if="{{condition}}> </view>
```

copy

```
Page({
  data: {
    condition: true,
  },
});
```

Keywords

The keywords need to be packaged with double quotation marks ("").

- True: boolean true
- False: boolean false

copy

```
<checkbox checked="{{false}}> </checkbox>
```

Note: Do not code directly `checked="false"`. The operation result is a string, and becomes the true value when converted into boolean type.

Operation

Simple operation can be packaged with two pairs of braces ({{ }}). The following operations are supported:

Ternary Operation

copy

```
<view hidden="{{flag ? true : false}}> Hidden </view>
```

Arithmetic Operation

copy

```
<view> {{a + b}} + {{c}} + d </view>
Page({
  data: {
    a: 1,
    b: 2,
    c: 3,
  },
});
```

Page output content is 3 + 3 + d

Logic Judgment

copy

```
<view a:if="{{length > 5}}> </view>
```

String Operation

copy

```
<view>{{"hello" + name}}</view>
```

copy

```
Page({
  data:{
    name: 'Mini Program',
  },
});
```

Data Path Operation

copy

```
<view>{{object.key}} {{array[0]}}</view>
```

copy

```
Page({
  data: {
    object: {
      key: 'Hello ',
    },
    array: ['Mini Program'],
  },
});
```

Combine

The combination can be done directly in the Mustache syntax to make up a new object or array.

Array

copy

```
<view a:for="{{[zero, 1, 2, 3, 4]}}"> {{item}} </view>
Page({
  data: {
    zero: 0,
  },
});
```

Finally combined into array [0, 1, 2, 3, 4]

Object

copy

```
<template is="objectCombine" data="{{foo: a, bar: b}}"></template>
Page({
  data: {
    a: 1,
    b: 2,
  },
});
```

Finally combined into object {foo: 1, bar: 2}.

Destructuring operator ... can be used to expand an object:

copy

```
<template is="objectCombine" data="{{...obj1, ...obj2, e: 5}}">
</template>
```

copy

```
Page({
  data: {
    obj1: {
      a: 1,
      b: 2,
    },
    obj2: {
      c: 3,
      d: 4,
    },
  },
});
```

```
},
});
```

Finally combined into object {a: 1, b: 2, c: 3, d: 4, e: 5}.

If the object key and value are the same, the indirect expression is as below:

copy

```
<template is="objectCombine" data="{{foo, bar}}"></template>
Page({
  data: {
    foo: 'my-foo',
    bar: 'my-bar',
  },
});
```

Finally combined into object {foo: 'my-foo', bar: 'my-bar'}

Note: The above methods can be combined randomly. When the variable names are the same, however, the latter overrides the former. For example:

copy

```
Page({
  data: {
    obj1: {
      a: 1,
      b: 2,
    },
    obj2: {
      b: 3,
      c: 4,
    },
    a: 5,
  },
});
```

Finally combined into object {a: 5, b: 3, c: 6}.

FAQ

Q: How to clear the data when jumping to a new page?

A: The data can not be cleared, you can override the data when jumping.

Data Reporting by Self-Defined Actions {#data-reporting-by-self-defined-actions}

Last updated: 2022-07-07

Path: miniprogram_gcash

Data Reporting by Self-Defined Actions

2022-07-07 17:08

This topic introduces data reporting by self-defined actions. With this method, you can define the actions with different parameters to collect and report data automatically.

Procedures

To report the data by self-defined actions, complete the following steps:

1. When defining an event, choose the *By Self-Defined Actions Data Reporting Method*.
2. Configure the action with the following parameters:
 - Define the trigger condition.
 - Define the report type. Two report types are supported:
 - Collect and Report Once
 - Collect Multiple Times and Report Once
 - Define the triggered page.
 - Define the triggered element.
 - Save and publish the actions.

Note:

If you choose the **Collect Multiple Times and Report Once** report type, you must specify that the action is used to collect or report data. After you select the **Collect Multiple Times and Report Once** report type, you can see the following fields:

- **Start:** Start to collect data.
- **Report:** Report the collected data.

The last one action must be used to report data.

Trigger conditions

The following trigger conditions are supported:

- **enterPage:** Triggered when users open a new page, return to the previous page, or switch to the foreground. Page must be specified.
- **click:** Triggered by a click event. Page and element must be specified.
- **leavePage:** Triggered when users exit a page or switching to the background. Page must be specified.

- `pageLoad`: Triggered when users open a new page for the first time. Page must be specified.
- `pageUnload`: Triggered when users reclaim a page. Page must be specified.
- `switchTab`: Triggered when calling the `my.switchTab` API to switch to another page. Page must be specified.
- `pullDownRefresh`: Triggered by pull-to-refresh event. Page must be specified.
- `launch`: Triggered when users load the mini program.
- `background`: Triggered when users switch to the background.
- `foreground`: Triggered when users switch to the foreground.
- `share`: Triggered when users share the page via the menu in the upper-right corner.

Data dictionary

2022-07-03 18:44

Model

Result

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || resultStatus |

String | No | Result status. Valid values are:

- `S` : Successful.

- `F` : Failed.

- `U` : Unknown.

- `A` : accepted, not yet succeed, but can proceed with some actions. || resultCode | String | No | Result code.

Max. length: 64 characters. || resultMessage | String | No | Result message that describes the result code in details.

Max. length: 256 characters. |

Message

Property	Data type	Required	Description	
messageId	String	Yes	The unique ID that identifies a message.	
customerID	String	Yes	The unique ID that is assigned by wallets to identify a customer.	
Example:	2188200000000000000023.			
messageChannel	MessageChannel	Yes	The channel to send a message.	
redirectUrl	String	No	The Mini Program page that is redirected to after the user clicks the PUSH/INBOX message. Therefore, for the PUSH/INBOX message, this property is required.	
messageContent	JSON String	Yes	The content of a message to send, for example:	
"{ "en-US": "Hello, World", "zh-CN": " }"				
Max. length:	4096 characters.			

MessageSendResult

Property	Data type	Required	Description	
messageId	String	Yes	The unique ID that identifies a message.	
success	Boolean	Yes	Indicates whether the message is sent successfully or not.	
- true	: the message is sent successfully.			
- false	: the message fails to send.	retry	Boolean	No
Indicates whether the wallet server allows you to retry when the message fails to send. Therefore, this field is required only when the value of the success field is false.				
The value of the retry field is:				
- true	: the wallet server allows to retry under specific circumstances, for example, when there are system exceptions.			
- false	: the wallet server does not allow to retry. For example, when the fatigue degree in the wallet server is reached, retry is not allowed.			

ContentTemplate

Property	Data type	Required	Description	
templateParameters	Map<String, String>	No	A string-to-string mapping. The data structure is in JSON format:	
"templateParameters": {"key": "value"}				
, where:				
- key	: represents the placeholder that is designed in the selected message template.			
- value	: is used to replace the value of the key parameter in the message template.	language	String	No
Indicates RFC 1766, such as zh-CN, en-US.				

Enum

MessageChannel

Key	Description
SMS	SMS.
PUSH	PUSH.
INBOX	INBOX.

OsType

||| | --- | --- | | **Key** | **Description** | | IOS | iOS. | | ANDROID | Android. |

Data dictionary (for v1)

2022-07-03 18:44

Model

Amount

||||| | --- | --- | --- | --- | | **Property** | **Data type** | **Required** | **Description** | | currency | String | Yes | The three-character ISO-4217 currency code.
Max. length: 3 characters. || value | String | Yes | A string that encloses a positive integer representing how much to charge in the smallest currency unit(e.g., 100 cents to charge \$1.00 or 100 to charge \$100, a zero-decimal currency).
Max. length: 16 characters. |

ActionForm

||||| | --- | --- | --- | --- | | **Property** | **Data type** | **Required** | **Description** | | actionFormType | String | No | The action form type. Enum:
ORDER_CODE,
REDIRECTION. || orderCode | String | No | The order code value.
Max. length: 2048 characters. || redirectionUrl | String | No | The url of redirect.
Max. length: 4096 characters. |

EnvInfo

||||| | --- | --- | --- | --- | | **Property** | **Data type** | **Required** | **Description** | | terminalType | String | No | The terminal type of this request.
Enum: [MINI_APP, APP, WEB, WAP, SYSTEM]. || osType | String | No | OS type.
Enum: [IOS, ANDROID] || userAgent | String | No | User agent.

Max. length: 1024 characters. || deviceTokenId | String | No | Token ID of the device.
 Max. length: 128 characters. || clientIp | String | No | IP address of the client device.
 Max. length: 64 characters. || cookieId | String | No | User cookie ID.
 Max. length: 128 characters. || extendInfo | String | No | Extend info.
 Max. length: 4096 characters. |

PaymentFactor

Property	Data type	Required	Description
isPaymentEvaluation	Boolean	No	An indicator of the payment evaluation. If the value is TRUE, the payment is only to evaluate whether the payment can be successful and no actual funds deduction occurs. The default value is FALSE.
isOrderCode	Boolean	No	If the payment scenario is the user scan the code presented by merchant and identify the order, and make payment. The default value is FALSE.
isPaymentCode	Boolean	No	An indicator of whether the payment scenario is the merchant scan the user payment code. The default value is FALSE.
isAgreementPay	Boolean	No	An indicator of whether the payment is an agreement payment. The default value is FALSE.
isCashierPayment	Boolean	No	An indicator of whether the payment is a cashier payment. The default value is FALSE.
isAuthorizationAndPay	Boolean	No	An indicator of whether to do agreementPay authorization during the payment. The default value is FALSE.
isAuthorizationPayment	Boolean	No	An indicator of whether the payment is an authorization payment. The default value is FALSE.

OpenLoginIdInfo

Property	Data type	Required	Description
loginId	String	No	Login Id is a identification for an user, which can be mobile number or email. User can use login Id to login Wallet.
loginIdType	String	Yes	Login id type, Enum: "MOBILE_PHONE", "EMAIL".
maskLoginId	String	No	Mask Login id, several bits of the phone number will be hidden to protect users' privacy.
hashLoginId	String	No	Hash login id. The login id hashed by hash algorithm. The external system can use it to compare it's login id hashed by the same hash algorithm to see if the login id is the same.
extendInfo	String	No	The extend information, wallet and merchant can put extend info here.

ContactInfo

Property	Data type	Required	Description
contactNo	String	Yes	Contact No. e.g mobile-phone No, e-mail address.
contactType	String	Yes	Contact type, there are agreed types(MOBILE_PHONE, TELEPHONE, EMAIL) that should be available to all users, developer can add new type, but developer should consider the compatibility.
extendInfo	String	No	The extend information, wallet and merchant can put extend info here.

OpenUserInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || userId | String
 | No | The hashed unique identifier allocated for user.
 Max. length: 64 characters. || status | String | No | User status, Enum: "ACTIVE",
 "FROZEN", "INACTIVE".
 Max. length: 32 characters. || nickName | String | No | Nick name.
 Max. length: 256 characters. || userName | **UserName** | No | User name, fullName and
 (firstName,middleName,lastName) can not both empty. || userAddresses | Array<
Address> | No | The user's address information. || avatar | String | No | Avatar url.
 Max. length: 256 characters. || gender | String | No | F: female; M: Male.
 Max. length: 32 characters. || birthday | String/Datetime | No | Birthday which follows
 the [ISO 8601](#) standard.
 Max. length: 32 characters. || nationality | String | No | Nationality, alpha-2 code
 according to [ISO3166](#). e.g. JP, US.
 Max. length: 32 characters. || loginIdInfos | Array< **OpenLoginIdInfo** > | No | User login
 id info list. || contactInfos | Array< **ContactInfo** > | No | Contact info list. || extendInfo |
 String | No | The extend information, wallet and merchant can put extend info here.
 Max. length: 4096 characters. |

PaymentMethod

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||
 paymentMethodType | String | Yes | Payment method type, used to identifier a payment
 method.
 Max. length: 32 characters. || paymentMethodId | String | No | The uniqueId of a
 customer belong to a paymentMethod.
 Max. length: 128 characters. || extendMetaData | String | No | Extended information.
 Max. length: 2048 characters. |

Result

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || resultStatus |
 String | No | Result status. Valid values are:
 - S: Successful
 - F: Failed
 - U: Unknown
 - A: accepted, not yet succeed, but can proceed with some actions. || resultCode | String |
 No | Result code.
 Max. length: 64 characters. || resultMessage | String | No | Result message that describes
 resultCode in detail.
 Max. length: 256 characters. |

UserName

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || fullName |
 String | No | Full Name.
 Max. length: 128 characters. || firstName | String | No | First Name.
 Max. length: 32 characters. || middleName | String | No | Middle Name.
 Max. length: 32 characters. || lastName | String | No | Last Name.
 Max. length: 32 characters. |

Order

		Property	Data type	Required	Description
referenceOrderId	String	Yes	The unique identification of the order on the merchant side. It is used for the display of user consumption records, and the subsequent payment operations such as customer complaints and disputes track.		
Max. length:	64 characters.	orderDescription	String	No	Description of the order used to display user consumption records, etc.
Max. length:	256 characters.	orderAmount	<u>Amount</u>	Yes	The amount of an order, like how much to charge in the specified currency unit for an order.
String/Datetime		orderCreateTime		No	Order create time from merchant which follows the <u>ISO 8601</u> standard.
Max. length:	32 characters.	referenceMerchant	<u>Merchant</u>	No	Merchant information.
goods	<u>Goods</u>	No	Goods information.	shipping	<u>Shipping</u>
buyer	<u>Buyer</u>	No	Buyer information.	extendInfo	String
No			Extended infomation data, this field includes information that are not common but needed for special use cases.		
Max. length:	2048 characters.				

Merchant

		Property	Data type	Required	Description
referenceMerchantId	String	Yes	Merchant ID.		
Max. length:	32 characters.	merchantMCC	String	Yes	Merchant MCC.
Max. length:	32 characters.	merchantName	String	Yes	Name of Merchant.
Max. length:	256 characters.	merchantDisplayName	String	No	Display name of merchant.
Max. length:	64 characters.	merchantAddress	<u>Address</u>	No	The address of merchant.
merchantRegisterDate	String/Datetime	No	Merchant register time from merchant which follows the <u>ISO 8601</u> standard.		
Max. length:	32 characters.	store	<u>Store</u>	No	Merchant store.

Address

		Property	Data type	Required	Description
region	String				
Yes	Alpha-2 code according to <u>ISO3166</u> . e.g. JP, US.				
Max. length:	2 characters.	state	String	No	State/County/Province.
Max. length:	8 characters.	city	String	No	City/District/Suburb/Town/Village.
Max. length:	32 characters.	address1	String	No	Address line 1(Street address/PO Box/Company name).
Max. length:	256 characters.	address2	String	No	Address line 2(Apartment/Suite/Unit/Building).
Max. length:	256 characters.	zipCode	String	No	ZIP or postal code.
Max. length:	32 characters.				

Store

		Property	Data type	Required	Description
referenceStoreId	String	Yes	The store belongs to a merchant, and the ID assigned by the corresponding merchant to the store is unique under the merchant.		
Max. length:	64 characters.	storeName	String	No	Name of store.
Max. length:	256 characters.	storeMCC	String	No	Store business category code.

Max. length: 32 characters. || storeDisplayName | String | No | Display name of store.
 Max. length: 64 characters. || storeTerminalId | String | No | Unique identifier of store's terminal.
 Max. length: 64 characters. || storeOperatorId | String | No | Unique identifier of store's terminal operator.
 Max. length: 64 characters. || storeAddress | Address | No | The address of the store. || storePhoneNo | String | No | Phone number of Store.
 Max. length: 16 characters. |

Goods

	Property	Data type	Required	Description
referenceGoodsId	String	Yes	Unique ID of goods.	
Max. length: 64 characters.	goodsName	String	Yes	Name of goods.
Max. length: 256 characters.	goodsCategory	String	No	Category of goods.
Max. length: 256 characters.	goodsBrand	String	No	Brand of goods.
Max. length: 32 characters.	goodsUnitAmount	<u>Amount</u>	No	Order amount for display of user consumption records, payment results page. goodsQuantity
Max. length: 32 characters.	String	No	Quantity of goods.	
Max. length: 32 characters.	goodsUrl	String	No	Goods url.
Max. length: 1024 characters.	extendInfo	String	No	The extend information of goods.
Max. length: 2048 characters.				

Shipping

	Property	Data type	Required	Description
shippingName				
<u>UserName</u>	Yes	Shipping name. shippingAddress	<u>Address</u>	Yes Shipping address. shippingCarrier
Max. length: 128 characters.	String	No	The delivery service that shipped a physical product, such as Fedex, UPS, USPS, etc.	
Max. length: 128 characters.	shippingPhoneNo	String	No	Recipient PhoneNo(including extension).
Max. length: 16 characters.	shippingFee	<u>Amount</u>	No	Shipping fee.

Buyer

	Property	Data type	Required	Description
referenceBuyerId	String	No	Unique Identification of buyer.	
Max. length: 64 characters.	buyerName	<u>UserName</u>	No	Buyer name. buyerPhoneNo
Max. length: 24 characters.	String	No	Mobile phone number of buyer.	

Enum

OsType

	Key	Description
IOS	iOS	iOS.
ANDROID	ANDROID	Android.

PaymentMethodType

```

Data dictionary (for v1)

2021-05-09 18:43

Model

Amount

```
||||||| --- | --- | --- | --- || Property | Data type | Required | Description || currency |
String | Yes | The three-character ISO-4217 currency code.
Max. length: 3 characters. || value | String | Yes | A string that encloses a positive integer
representing how much to charge in the smallest currency unit(e.g., 100 cents to charge
$1.00 or 100 to charge $100, a zero-decimal currency).
Max. length: 16 characters. |
```

ActionForm

```
||||||| --- | --- | --- | --- || Property | Data type | Required | Description ||
actionFormType | String | No | The action form type. Enum:
ORDER_CODE,
REDIRECTION. || orderCode | String | No | The order code value.
Max. length: 2048 characters. || redirectionUrl | String | No | The url of redirect.
Max. length: 4096 characters. |
```

EnvInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || terminalType | String | No | The terminal type of this request.
 Enum: [MINI_APP, APP, WEB, WAP, SYSTEM]. || osType | String | No | OS type.
 Enum: [IOS, ANDROID] || userAgent | String | No | User agent.
 Max. length: 1024 characters. || deviceTokenId | String | No | Token ID of the device.
 Max. length: 128 characters. || clientIp | String | No | IP address of the client device.
 Max. length: 64 characters. || cookieId | String | No | User cookie ID.
 Max. length: 128 characters. || extendInfo | String | No | Extend info.
 Max. length: 4096 characters. |

PaymentFactor

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||
 isPaymentEvaluation | Boolean | No | An indicator of the payment evaluation. If the value is TRUE, the payment is only to evaluate whether the payment can be successful and no actual funds deduction occurs. The default value is FALSE. || isOrderCode | Boolean | No | If the payment scenario is the user scan the code presented by merchant and identify the order, and make payment. The default value is FALSE. || isPaymentCode | Boolean | No | An indicator of whether the payment scenario is the merchant scan the user payment code. The default value is FALSE. || isAgreementPay | Boolean | No | An indicator of whether the payment is an agreement payment. The default value is FALSE. || isCashierPayment | Boolean | No | An indicator of whether the payment is a cashier payment. The default value is FALSE. || isAuthorizationAndPay | Boolean | No | An indicator of whether to do agreementPay authorization during the payment. The default value is FALSE. || isAuthorizationPayment | Boolean | No | An indicator of whether the payment is an authorization payment. The default value is FALSE. |

OpenLoginIdInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || loginId | String | No | Login Id is a identification for an user, which can be mobile number or email. User can use login Id to login Wallet.
 Max. length: 64 characters. || loginIdType | String | Yes | Login id type, Enum: "MOBILE_PHONE", "EMAIL".
 Max. length: 64 characters. || maskLoginId | String | No | Mask Login id, several bits of the phone number will be hidden to protect users' privacy.
 Max. length: 64 characters. || hashLoginId | String | No | Hash login id. The login id hashed by hash algorithm. The external system can use it to compare it's login id hashed by the same hash algorithm to see if the login id is the same.
 Max. length: 256 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.
 Max. length: 4096 characters. |

ContactInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || contactNo | String | Yes | Contact No. e.g mobile-phone No, e-mail address.
 Max. length: 64 characters. || contactType | String | Yes | Contact type, there are agreed types(MOBILE_PHONE, TELEPHONE, EMAIL) that should be available to all users, developer can add new type, but developer should consider the compatibility.

Max. length: 32 characters. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

OpenUserInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || userId | String | No | The hashed unique identifier allocated for user.

Max. length: 64 characters. || status | String | No | User status, Enum: "ACTIVE", "FROZEN", "INACTIVE".

Max. length: 32 characters. || nickName | String | No | Nick name.

Max. length: 256 characters. || userName | UserName | No | User name, fullName and (firstName,middleName,lastName) can not both empty. || userAddresses | Array< Address > | No | The user's address information. || avatar | String | No | Avatar url.

Max. length: 256 characters. || gender | String | No | F: female; M: Male.

Max. length: 32 characters. || birthday | String/Datetime | No | Birthday which follows the ISO 8601 standard.

Max. length: 32 characters. || nationality | String | No | Nationality, alpha-2 code according to ISO3166. e.g. JP, US.

Max. length: 32 characters. || loginIdInfos | Array< OpenLoginIdInfo > | No | User login id info list. || contactInfos | Array< ContactInfo > | No | Contact info list. || extendInfo | String | No | The extend information, wallet and merchant can put extend info here.

Max. length: 4096 characters. |

PaymentMethod

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || paymentMethodType | String | Yes | Payment method type, used to identifier a payment method.

Max. length: 32 characters. || paymentMethodId | String | No | The uniqueId of a customer belong to a paymentMethod.

Max. length: 128 characters. || extendMetaData | String | No | Extended information.

Max. length: 2048 characters. |

Result

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || resultStatus | String | No | Result status. Valid values are:

- S: Successful

- F: Failed

- U: Unknown

- A: accepted, not yet succeed, but can proceed with some actions. || resultCode | String | No | Result code.

Max. length: 64 characters. || resultMessage | String | No | Result message that describes resultCode in detail.

Max. length: 256 characters. |

UserName

Property	Data type	Required	Description
fullName	String	No	Full Name.
Max. length:	128 characters.	firstName	String
Max. length:	32 characters.	middleName	String
Max. length:	32 characters.	lastName	String
Max. length:	32 characters.		

Order

Property	Data type	Required	Description
referenceOrderId	String	Yes	The unique identification of the order on the merchant side. It is used for the display of user consumption records, and the subsequent payment operations such as customer complaints and disputes track.
Max. length:	64 characters.	orderDescription	String
Max. length:	32 characters.	orderAmount	<u>Amount</u>
Max. length:	256 characters.	orderCreateTime	String/Datetime
Max. length:	32 characters.	referenceMerchant	<u>Merchant</u>
Max. length:	32 characters.	goods	<u>Goods</u>
Max. length:	32 characters.	shipping	<u>Shipping</u>
Max. length:	32 characters.	buyer	<u>Buyer</u>
Max. length:	2048 characters.	extendInfo	String
			No Extended infomation data, this field includes information that are not common but needed for special use cases.

Merchant

Property	Data type	Required	Description
referenceMerchantId	String	Yes	Merchant ID.
Max. length:	32 characters.	merchantMCC	String
Max. length:	32 characters.	merchantName	String
Max. length:	256 characters.	merchantDisplayName	String
Max. length:	32 characters.	merchantAddress	<u>Address</u>
Max. length:	32 characters.	merchantRegisterDate	String/Datetime
Max. length:	32 characters.	store	<u>Store</u>
			No Merchant register time from merchant which follows the <u>ISO 8601</u> standard.
			No Merchant store.

Address

Property	Data type	Required	Description
region	String		
Max. length:	2 characters.	state	String
Max. length:	8 characters.	city	String
Max. length:	32 characters.	address1	String
Max. length:	256 characters.	address2	String
			No Address line 1(Street address/PO Box/Company name).
			No Address line

2(Apartment/Suite/Unit/Building).

Max. length: 256 characters. || zipCode | String | No | ZIP or postal code.

Max. length: 32 characters. |

Store

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||

referenceStoreId | String | Yes | The store belongs to a merchant, and the ID assigned by the corresponding merchant to the store is unique under the merchant.

Max. length: 64 characters. || storeName | String | No | Name of store.

Max. length: 256 characters. || storeMCC | String | No | Store business category code.

Max. length: 32 characters. || storeDisplayName | String | No | Display name of store.

Max. length: 64 characters. || storeTerminalId | String | No | Unique identifier of store's terminal.

Max. length: 64 characters. || storeOperatorId | String | No | Unique identifier of store's terminal operator.

Max. length: 64 characters. || storeAddress | Address | No | The address of the store. || storePhoneNo | String | No | Phone number of Store.

Max. length: 16 characters. |

Goods

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||

referenceGoodsId | String | Yes | Unique ID of goods.

Max. length: 64 characters. || goodsName | String | Yes | Name of goods.

Max. length: 256 characters. || goodsCategory | String | No | Category of goods.

Max. length: 256 characters. || goodsBrand | String | No | Brand of goods.

Max. length: 32 characters. || goodsUnitAmount | Amount | No | Order amount for display of user consumption records, payment results page. || goodsQuantity | String | No | Quantity of goods.

Max. length: 32 characters. || goodsUrl | String | No | Goods url.

Max. length: 1024 characters. || extendInfo | String | No | The extend information of goods.

Max. length: 2048 characters. |

Shipping

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || shippingName

| UserName | Yes | Shipping name. || shippingAddress | Address | Yes | Shipping

address. || shippingCarrier | String | No | The delivery service that shipped a physical product, such as Fedex, UPS, USPS, etc.

Max. length: 128 characters. || shippingPhoneNo | String | No | Recipient PhoneNo(including extension).

Max. length: 16 characters. || shippingFee | Amount | No | Shipping fee. |

Buyer

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||

referenceBuyerId | String | No | Unique Identification of buyer.

Max. length: 64 characters. || buyerName | UserName | No | Buyer name. ||

buyerPhoneNo | String | No | Mobile phone number of buyer.
Max. length: 24 characters. |

Enum

OsType

||| --- | --- || **Key** | **Description** || IOS | iOS. || ANDROID | Android. |

PaymentMethodType

||| --- | --- || **Key** | **Description** || BALANCE | Balance. || COUPON | Coupon. || CREDIT_CARD | Credit Card. || DEBIT_CARD | Debit Card. |

TerminalType

||| --- | --- || **Key** | **Description** || MINI_APP | Mini program. || APP | Mobile Application. || WEB | Broswer Web. || WAP | Mobile Wap. || SYSTEM | System Call. |

Data dictionary (for v2)

2022-07-05 23:31

Model

Amount

||||| --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || currency | String | Yes | The three-character ISO-4217 currency code.
Max. length: 3 characters. || value | String | Yes | A string that encloses a positive integer representing how much to charge in the smallest currency unit(e.g., 100 cents to charge \$1.00 or 100 to charge \$100, a zero-decimal currency).
Max. length: 16 characters. |

ActionForm

Property	Data type	Required	Description
actionFormType	String	No	The action form type.
	Enum: [ORDER_CODE, REDIRECTION]		orderCode String No The order code value. The order code is generated by merchants, which is a QR code with order information for customers to scan.
			Max. length: 2048 characters.
	redirectionUrl	String	No The URL of redirect.
			Max. length: 4096 characters.

Env

Property	Data type	Required	Description
terminalType	String	No	The terminal type of this request.
	Enum: [MINI_APP, APP, WEB, WAP, SYSTEM]		osType String No OS type.
	Enum: [IOS, ANDROID]		userAgent String No User agent.
			Max. length: 1024 characters.
	deviceTokenId	String	No Token ID of the device.
			Max. length: 128 characters.
	clientIp	String	No IP address of the client device.
			Max. length: 64 characters.
	cookieId	String	No User cookie ID.
			Max. length: 128 characters.
	storeTerminalId	String	No The store terminal ID.
			Max. length: 64 characters.
	storeTerminal		RequestTime String/Datetime No The store terminal request time.
			Max. length: 32 characters.
	extendInfo	String	No Extend info.
			Max. length: 4096 characters.

PaymentFactor

Property	Data type	Required	Description
needSurcharge	Boolean	No	An indicator of a surcharge, which appears in the request from APS to Mobile Payment Partner. If the value is TRUE, the fields surchargeAmount and surchargeQuote must be specified. The default value is FALSE.
			isPaymentEvaluation Boolean No An indicator of the payment evaluation. If the value is TRUE, the payment is only to evaluate whether the payment can be successful and no actual funds deduction occurs. The default value is FALSE.
			isAuthorizationAndPay Boolean No An indicator of whether to do authorization for the agreement payment (Auto Debit) during the payment. The default value is FALSE.
			isAuthorizationPayment Boolean No An indicator of whether the payment is an authorization payment. The default value is FALSE.
			isDeferredPayment Boolean No An indicator of whether the payment is a deferred payment, in which scenario the user uses the product or service in advance.
			needCheckCompliance Boolean No An indicator of whether the payment information must be validated to meet compliances before the payment is processed.
			needOtpVerification Boolean No An indicator of whether the payment needs to verify OTP (one time password).
			isCrossborderSettlement Boolean No An indicator of whether the payment requires cross-border settlement.
			inStorePaymentScenario Boolean No An indicator of PaymentCode/OrderCode/EntryCode .

User

Property	Data type	Required	Description
userId	String		No The hashed unique identifier allocated for user.
			Max. length: 64 characters.
	status	String	No User status, Enum: "ACTIVE",

"FROZEN", "INACTIVE"

Max. length: 32 characters. || nickName | String | No | Nick name.

Max. length: 256 characters. || userName | UserName | No | User name, fullName and (firstName,middleName,lastName) can not both empty. || userAddresses | Array< Address > | No | The user's address information. || avatar | String | No | Avatar url.

Max. length: 256 characters. || gender | String | No | F: female; M: Male.

Max. length: 32 characters. || birthDate | String/Datetime | No | Birth date which follows the ISO 8601 standard.

Max. length: 32 characters. || nationality | String | No | Nationality, alpha-2 code according to ISO3166. e.g. JP, US.

Max. length: 32 characters. || loginIdInfos | Array< LoginIdInfo > | No | A list of user login IDs. || contactInfos | Array< ContactInfo > | No | A list of contact information. || extendInfo | String | No | The extend information,wallet and merchant can put extend info here.

Max. length: 4096 characters. |

LoginIdInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || loginIdType |

String | Yes | The types of Login ID:

- MOBILE_PHONE
- EMAIL
- OTHER

Max. length: 64 characters. || loginId | String | No | An unique identifier for an user's ID login, which can be a mobile number or an email address. Users can use their login ID that without hidden bits to log in to the Wallet.

Max. length: 64 characters. || maskLoginId | String | No | Mask Login ID that represents several bits of the phone number that are hidden to protect users' privacy.

Max. length: 64 characters. || hashLoginId | String | No | Hash login ID that identifies an loginId that is hashed by a hash algorithm. The external system can use it to compare its login ID that is hashed by the same hash algorithm to check whether the login ID is identical.

Max. length: 256 characters. || extendInfo | String | No | The extensive information for wallets and merchants to add.

Max. length: 4096 characters. |

ContactInfo

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || contactType |

String | Yes | The followings are contact types that are available to all users:

- MOBILE_PHONE
- TELEPHONE
- EMAIL

Tips: Developer can add new types, but should consider the compatibility.

Max. length: 32 characters. || contactNo | String | Yes | The value that corresponds to the contact type that is configured in the contactType field. For example, this field can be mobile phone numer, or e-mail address.

Max. length: 64 characters. || extendInfo | String | No | The extensive information for wallets and merchants to add.

Max. length: 4096 characters. |

PaymentMethod

Property	Data type	Required	Description
paymentMethodType	String	Yes	Payment method type, used to identifier a payment method.
			Max. length: 32 characters.
paymentMethodId	String	No	The uniqueId of a customer belong to a paymentMethod.
paymentMethodMetaData	String	No	Max. length: 128 characters. The payment method metadata.
			Max. length: 2048 characters.

Result

Property	Data type	Required	Description	resultStatus
			String	No
			Result status. Valid values are:	
- S	: Successful			
- F	: Failed			
- U	: Unknown			
- A	: accepted, not yet succeed, but can proceed with some actions.		resultCode	String
			No	Result code.
resultMessage	String	No	Max. length: 64 characters.	Result message that describes the result code in details.
			Max. length: 256 characters.	

UserName

Property	Data type	Required	Description	fullName
			String	No
			Full Name.	
firstName	String	No	Max. length: 128 characters.	First Name.
middleName	String	No	Max. length: 32 characters.	Middle Name.
lastName	String	No	Max. length: 32 characters.	Last Name.
			Max. length: 32 characters.	

Order

Property	Data type	Required	Description
referenceOrderId	String	Yes	referenceOrderId String Yes The unique identification of the order on the merchant side. It is used for the display of user consumption records, and the subsequent payment operations such as customer complaints and disputes track.
orderDescription	String	Yes	Max. length: 64 characters. orderDescription String Yes Description of the order used to display user consumption records, etc.
orderAmount	<u>Amount</u>	Yes	Max. length: 256 characters. orderAmount <u>Amount</u> Yes The amount of an order, like how much to charge in the specified currency unit for an order. orderCreateTime String/Datetime No Order create time from merchant which follows the <u>ISO 8601</u> standard.
merchant	<u>Merchant</u>	Yes	Max. length: 32 characters. merchant <u>Merchant</u> Yes Merchant information. goods <u>Array< Good ></u> No Goods information. shipping <u>Shipping</u> No Shipping information. buyer <u>Buyer</u> No Buyer information. env <u>Env</u> No The order environment information, such as the device information. extendInfo String No Extended infomation data, this field includes information that are not common but needed for special use cases.
			Max. length: 2048 characters.

Transaction

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||
 transactionResult | Result | Yes | The transaction result, which contains information related to the business result and error information. || transactionType | String | Yes | Transaction type for each subsequent payment activity. || transactionRequestId | String | No | The unique ID assigned by merchant to identify the transaction request. When the transaction type is CAPTURE, the value of this field is identical to captureRequestId. When the transaction type is REFUND, the value of this field is identical to refundRequestId. || transactionId | String | Yes | The unique ID assigned by wallet to identify a transaction. When the transaction type is CAPTURE, the value of this field is identical to captureId. When the transaction type is REFUND, the value of this field is identical to refundId. || transactionStatus | String | No | Transaction status type. || transactionAmount | Amount | Yes | Transaction amount. When the transaction type is CAPTURE, the value of this field is identical to captureAmount. When the transaction type is REFUND, the value of this field is identical to refundAmount. || transactionTime | Date | No | Transaction time || isLastCapture | String | No | Only for capture transaction || voidSource | String | No | void source || extendInfo | String | No | The extensive information. The wallet and merchant can put extensive information in this property. Max. length: 4096 characters. |

Merchant

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** ||
 referenceMerchantId | String | Yes | Merchant ID.
 Max. length: 32 characters. || merchantMCC | String | Yes | Merchant MCC (merchant category code).
 Max. length: 32 characters. || merchantName | String | Yes | Name of Merchant.
 Max. length: 256 characters. || merchantDisplayName | String | No | Display name of merchant.
 Max. length: 64 characters. || merchantAddress | Address | No | The address of merchant.
 || merchantRegisterDate | String /Datetime | No | Merchant register time from merchant which follows the ISO 8601 standard.
 Max. length: 32 characters. || store | Store | No | Merchant store. |

Address

||||| --- | --- | --- | --- || **Property** | **Data type** | **Required** | **Description** || region | String | Yes | Alpha-2 code according to ISO3166. e.g. JP, US.
 Max. length: 2 characters. || state | String | No | State/County/Province.
 Max. length: 8 characters. || city | String | No | City/District/Suburb/Town/Village.
 Max. length: 32 characters. || address1 | String | No | Address line 1(Street address/PO Box/Company name).
 Max. length: 256 characters. || address2 | String | No | Address line 2(Apartment/Suite/Unit/Building).
 Max. length: 256 characters. || label | String | No | Label for address, e.g home, company.
 Max. length: 64 characters. || zipCode | String | No | ZIP or postal code.
 Max. length: 32 characters. || extendInfo | String | No | The extend information of goods.
 Max. length: 4096 characters. |

Store

Property	Data type	Required	Description			
referenceStoreId	String	Yes	The store belongs to a merchant, and the ID assigned by the corresponding merchant to the store is unique under the merchant.			
Max. length:	64 characters.		storeName	String	No	Name of store.
Max. length:	256 characters.		storeMCC	String	No	Store business category code.
Max. length:	32 characters.		storeDisplayName	String	No	Display name of store.
Max. length:	64 characters.		storeTerminalId	String	No	Unique identifier of store's terminal.
Max. length:	64 characters.		storeOperatorId	String	No	Unique identifier of store's terminal operator.
Max. length:	64 characters.		storeAddress	<u>Address</u>	No	The address of the store.
Max. length:	16 characters.		storePhoneNo	String	No	Phone number of Store.

Goods

Property	Data type	Required	Description			
referenceGoodsId	String	Yes	Unique ID of goods.			
Max. length:	64 characters.		goodsName	String	Yes	Name of goods.
Max. length:	256 characters.		goodsCategory	String	No	Category of goods.
Max. length:	256 characters.		goodsBrand	String	No	Brand of goods.
Max. length:	32 characters.		goodsUnitAmount	<u>Amount</u>	Yes	Order amount for display of user consumption records, payment results page.
Max. length:	1024 characters.		goodsQuantity	String	No	Quantity of goods.
Max. length:	32 characters.		goodsSkuName	String	No	Goods sku name.
Max. length:	64 characters.		goodsUrl	String	No	Goods url.
Max. length:	2048 characters.		extendInfo	String	No	The extend information of goods.

Shipping

Property	Data type	Required	Description			
shippingName						
<u>UserName</u>	String	Yes	Shipping name.			
Max. length:	128 characters.		shippingAddress	<u>Address</u>	Yes	Shipping address.
Max. length:	64 characters.		shippingCarrier	String	No	The delivery service that shipped a physical product, such as Fedex, UPS, USPS, etc.
Max. length:	16 characters.		shippingPhoneNo	String	No	Recipient PhoneNo(including extension).

Max. length: 16 characters.

Buyer

Property	Data type	Required	Description			
referenceBuyerId	String	No	Unique Identification of buyer.			
Max. length:	64 characters.		buyerName	<u>UserName</u>	No	Buyer name.
Max. length:	24 characters.		buyerPhoneNo	String	No	Mobile phone number of buyer.

ContentTemplate

Property | Data type | Required | Description ||
templateParameters | Map<String,String> | No | A string-to-string mapping. The data structure is in JSON format:
"templateParameters": {"key": "value"}
, where:
- key : represents the variable that is defined in the template.
- value : is used to replace the value of the key parameter in the template. || language |
String | No | RFC 1766, such as zh-CN, en-US. |

RedirectActionForm

					Property	Data type	Required	Description		method
					String	String	No	The HTTP method. The value is POST or GET .	parameters	String
							No	The parameters that are required for the HTTP method, which is in the key:value pair format.		
					Max. length: 2048 characters.	String	Yes	The URL of redirect.	redirectUrl	String
					Max. length: 2048 characters.					

Message

					Property	Data Type	Required	Description	
					messageId	String	Yes	The unique ID is generated by Mini Program Platform to identify a notification.	

- Maximum length: 64 characters.
 - Characters not allowed: special characters such as @, #, ? and so on.

Note: This field is an API idempotency field. For the notifications which are sent with the same `requestId` and reach an S status, the native app must return the same `messageId`. See the [Idempotency](#) for details about API idempotency. || `customerId` | String | Yes | The unique ID is generated by the native app to identify a user.

Maximum length: 32 characters. || messageChannel | MessageChannel | Yes | The channels to send a notification, including push, SMS, and Inbox. || templateCode | String | No | Indicates the template ID that is generated by Mini Program Platform to identify a template.

- Maximum length: 64 characters.
 - Characters not allowed: special characters such as @, #, ? and so on.
 - Can be Null. || messageContent | String | Yes | The specific content that a notification to send

Maximum length: 4096 characters

- Can be Null.

```

MessageSendResult

	Property	Data Type	Required	Description
messageId	String	Yes	The unique ID is generated by Mini Program Platform to identify a notification.	
- Maximum length: 64 characters.				
- Characters not allowed: special characters such as @, #, ? and so on.				
Note: This field is an API idempotency field. For the notifications which are sent with the same requestId and reach an S status, the native app must return the same messageId. See the Idempotency for details about API idempotency.	success	Boolean	Yes	
Indicates whether the notification is successfully sent to the native app. Valid values are:				
- true: The notification is sent successfully.				
- false: The notification fails to send.	retry	Boolean	No	
Indicates whether the native app allows you to retry when the notification fails to send. Valid values are:				
- true: The native app server allows to retry under specific scenarios, for example, when there are system exceptions.				
- false: The native app server does not allow to retry. For example, when the delivery frequency of the notification is beyond the limits set by the native app, retry is not allowed.				
Note: This field is required when the value of the success field is false.				

Enum

Define an event {#define-an-event}

Last updated: 2022-07-07

Path: miniprogram_gcash

Define an event

2022-07-07 17:08

Data is stored and analyzed based on an event, which is triggered by user interaction with a mini program. See [Event management and analysis](#) for more details.

User experience

For example, the following figure illustrates the purchase process of an e-commerce mini program user:

Based on the user journey above, you can define the following events:

- View the home page
- View product details
- Add the product to shopping cart
- Submit an order
- Pay

Procedures

This section describes in detail how to define an event in four major steps:

1. Create an event

2. Enter the event name
3. Choose the data reporting method
4. Save the event

The "submit an order" and "view the home page" events mentioned above will serve as examples to illustrate the procedures.

1. Create an event

1. Go to **Analytics > Performance > My Analysis**;
2. Choose the mini program that you want to perform data analysis on;
3. Click **Manage Event**;
4. Click **+ New Event** on the **Manage Event** page.

2. Enter the event name

Enter an event name that complies with the naming rules. For example, `submitOrder` will be a suitable name for the "submit an order" event.

3. Choose the data reporting method

Data reporting methods define how data are to be analyzed. For example, with the Data Reporting by Self-Defined Actions method, you can define actions with different parameters to collect and report data automatically. For more information, see [Data Reporting by Self-Defined Actions](#).

You need to define an action and assign the following parameters:

- Trigger
- Report Type
- Page
- Element
- Field Name
- Field Value
- Field Type
- Note

Trigger

Trigger conditions. For example, `click` indicates that the event is triggered by clicking. For more information, see [Trigger Conditions](#);

Report Type

The action occurs when the event is triggered. You can choose either of the following two types:

- Collect and report once: data collected on a user's single action.
- Collect multiple times and report once: data collected on a user's multiple actions.

Collect and Report Once

If you choose this report type, data are reported with one action. Take "submit an order" event as an example:

You also need to configure the **Action** with the following parameters:

- **Page:** This triggers a page, so you would need to enter the page path. You can find the page path via app.json files in the mini program source code of IDE (Mini Program Studio). For this action, pages/shopping-cart/shopping-cart is appropriate.

copy

```
app.json:
{
  "pages": [\n    "pages/handbag/handbag",\n    "pages/shopping-cart/shopping-cart",\n    "pages/confirm-order/confirm-order",\n    "pages/my-order/my-order"\n  ]
}
```

- **Element:** Enter a class or ID, which must begin with ". ." or "#". You can find the element via app.json files in mini program source code of IDE (Mini Program Studio). For this action, developers have defined .cart-footer_action as the class for submitting an order.

Note: **Page** and **Element** may be optional for other trigger conditions.

copy

```
pages/shopping-cart/shopping-cart.axml:
<view class="cart-footer">
  <view class="cart-footer__desc">
    <view class="cart-footer__price-section">
      <view class="cart-footer__total-desc">Total </view>
      <view class="cart-footer__total-price">¥{{submitAmount}}</view>
    </view>
    <view class="cart-footer__discount">
      Total reduce ¥{{totalDiscount}} store reduce
      {{shopDiscount}}
    </view>
  </view>
  <view class="cart-footer__action" onTap="onSubmit">
    submit ({{count}})
  </view>
</view>
```

- **Field Name:** Fields are the metrics you would like to analyze. You can define a name and assign attributes to this metric via the **Field Value** and **Field Type**.
- **Field Value:** Enter a variable for the field. For this example, developers have defined submitAmount as the field to calculate the total price for the submitted orders. For **Field Value**, you need to enter the variable that is defined by developers in IDE.

copy

```
pages/shopping-cart/shopping-cart.js:  
Page({  
    data: {  
        count: 0,  
        totalDiscount: 0,  
        shopDiscount: 50,  
        time: new Date,  
        state: '',  
        submitAmount: 0,  
        total: 0,  
        commodity: [],  
        allChecked : true,  
        selectedCommoditys : []  
    },  
    onLoad() {  
        my.setNavigationBar({  
            title: 'Shopping Cart',  
        });  
    },  
    onShow() {  
        let commodityNum = 0;  
        let sumAmount = 0;  
        let shoppingCartInfo = getShoppingCartInfo();  
        let totalDiscount = 0;  
        let commodity = [];  
        if(shoppingCartInfo.length != 0){  
            shoppingCartInfo.forEach(element => {  
                commodityNum += element.purchaseNum;  
                sumAmount += (element.commodity.price * element.purchaseNum);  
                let targetCommodity = {title: element.commodity.title,  
                                      description:element.commodity.type,  
                                      price:element.commodity.price,  
                                      num:element.purchaseNum,  
                                      id:element.commodity.id,  
                                      image:element.commodity.cover,  
                                      checked:true};  
                commodity[commodity.length] = targetCommodity;  
            });  
            totalDiscount=conmodityNum-1;  
        }  
        this.setData({  
            count: commodityNum,  
            totalDiscount: totalDiscount,  
            shopDiscount: 50,
```

```
        time: new Date,
        state: '',
        submitAmount: sumAmount,
        total: 0,
        commodity: commodity,
        selectedCommoditys : []
    );
},
onSubmit(){
    if(this.data.count == 0){
        alert("The shopping cart is empty");
    }
    this.fetchCheckedCommodity();
    addOrderData(this.data.selectedCommoditys);
    my.navigateTo({
        url: '/pages/confirm-order/confirm-order',
    })
},
onChange(e) {
    let checkedValues = e.detail.value;
    if(checkedValues.length != 0){
        checkedValues.forEach(checkedValue =>{
            fetchSingleCommodity();
        });
    }
},
fetchSingleCommodity(id){
    this.data.commodity.forEach(item =>{
        if(item.id === id){

this.data.selectedCommoditys[this.data.selectedCommoditys.length] =
item;
    }
    });
},
fetchCheckedCommodity(){
    this.data.commodity.forEach(item =>{
        if(item.checked === true){

this.data.selectedCommoditys[this.data.selectedCommoditys.length] =
item;
    }
    });
},
goToStoreGoods(){
    my.switchTab({
        url: 'pages/handbag/handbag'
    })
}
});
```

- **Field Type:**

- **Int** (integer) is suitable for calculating amounts, where you can further define its maximum, minimum, count, sum, and average. For example, you can view data on the minimum total price for the `submitAmount` field when analyzing this event.
- **String** is suitable for calculating the count of each occurrence. For example, you can view data on the number of order IDs under this event. **Int** type would not be suitable here as each order ID does not have a maximum, minimum, sum, or average amount.
- **Note:** You can describe fields in detail.

Collect Multiple Times and Report Once

If you choose this report type, which consists of multiple actions, you can see the following fields:

- **Start:** start to collect data
- **Report:** report the collected data

The last action must be to report data.

Take the "visit the home page" as an example. Data collection and reporting of the `homePageUserBehavior` event includes two actions: enter the **Home** page and click the **Popularity List** tab.

You need to configure the **Action1** with the following parameters:

- **Page:** This triggers a page, so you would need to enter the page path. You can find the page path via app.json files in mini program source code of IDE (Mini Program Studio). For this action, `pages/handbag/handbag` is appropriate.

copy

```
app.json:
{
  "pages": [
    "pages/handbag/handbag",
    "pages/shopping-cart/shopping-cart",
    "pages/confirm-order/confirm-order",
    "pages/my-order/my-order"
  ]
}
```

- **Field Name:** Fields are the metrics you would like to analyze. You can define a name and assign attributes to this metric via the **Field Value** and **Field Type**.
- **Field Value:** Enter a variable for the field. For this example, developers have defined `activeTabName` as the field to calculate the count of home page visits.

copy

```
pages/handbag/handbag.js:
Page({
  data: {
```

```

        activeTabName : "All"
    },
    onShow() {
        const { searchValue = '' } = getApp();
        this.setData({ searchValue });
        this.fetchCurrentCommodities(this.data.activeTabId);
    },
    onActiveTabChange(id) {
        this.setData({ activeTabId: id, activeTabName: this.data.tabs[id - 1].name });
        this.fetchCurrentCommodities(id);
    }
});

```

- **Field Type:**

- **Int** (integer) is suitable for calculating amounts, where you can further define its maximum, minimum, count, sum, and average. For example, you can view data on the minimum total price for submitted orders when analyzing an event.
- **String** is suitable for calculating the count of each occurrence. For example, you can view data on the number of home page visits. **Int** type would not be suitable here as each home page visit does not have a maximum, minimum, sum, or average amount.
- **Note:** You can describe fields in detail.

You need to configure the **Action 2** with the following parameters:

- **Page:** This triggers a page, so you would need to enter the page path. You can find the page path via app.json files in mini program source code of IDE (Mini Program Studio). As **Action 2** occurs on the same page as **Action 1**, pages/handbag/handbag entered here as well.

copy

```

app.json:
{
    "pages": [
        "pages/handbag/handbag",
        "pages/shopping-cart/shopping-cart",
        "pages/my/my",
        "pages/my-order/my-order",
        "pages/confirm-order/confirm-order"
    ]
}

```

- **Element:** Enter a class or ID, which must begin with ". ." or "#". You can find the element via app.json files in mini program source code of IDE (Mini Program Studio). For this action, enter #TREND, which is defined as the ID for the **Popularity List** tab.

copy

```
pages/handbag/handbag.axml:
<view
    a:for="{{tabs}}"
    class="tab-item {{activeId==item.id?'tab-item--active':''}}"
    onTap="onActiveTabChange"
    data-index="{{item.id}}"
    id="TREND">
    {{item.title}}
    <image
        a:if="{{item.sortable}}"
        src="https://gw.alipayobjects.com/mdn/rms_107da2/afts/img/A*WR7tS62_iP\"
        mode="scaleToFill"
    />
</view>
```

- **Field Name:** Fields are the metrics you would like to analyze. You can define a name and assign attributes to this metric via the **Field Value** and **Field Type**.
- **Field Value:** Enter a variable for the field. For this example, developers have defined `activeTabName` as the field to calculate the count of **Popularity List** tab clicks.

copy

```
pages/handbag/handbag.js:
Page({
  data: {
    activeTabName : "All"
  },
  onShow() {
    const { searchValue = '' } = getApp();
    this.setData({ searchValue });
    this.fetchCurrentCommodities(this.data.activeTabId);
  },
  onActiveTabChange(id) {
    this.setData({ activeTabId: id, activeTabName: this.data.tabs[id -1].name });
    this.fetchCurrentCommodities(id);
  }
});
```

- **Field Type:**
- **Int** (integer) is suitable for calculating amounts, where you can further define its maximum, minimum, count, sum, and average. For example, you can view data on the minimum total price for submitted orders when analyzing an event.
- **String** is suitable for calculating the count of each occurrence. For example, you can view data on the number of tab visits. **Int** type would not be suitable here as each tab visit does not have a maximum, minimum, sum, or average amount.
- **Note:** You can describe fields in detail.

4. Save the event

Confirm all the fields and click **Save** to complete defining an event.

Developer's guide overview

2021-05-09 18:43

This developer guide is intended for mini program developers to learn how to quickly get started with mini program development.

In this guide, you can see basic concepts about the mini program technology. You can get the available reference resources, such as the Java Script APIs (JSAPIs), Components, Frameworks, and so on. You can also see how JSAPIs and Open APIs combine to be a capability. In addition, you can also quickly get started with quick-start procedures.

About mini program

Mini Program is a new technology that embeds a mobile program into the mobile app. End users can benefit from a similar experience without installing the native app. For developers, mini program provides the following benefits:

- Low learning curve as it is based on web technologies
- One code project supports both iOS and Android platform, close to the native experience
- Built-in rich components and APIs (such as access to user info, local storage, payment function, etc.)

Below is a process that illustrates how mini programs are developed by web developers to users.

Developers can use the web technology and start debugging in the Integrated Development Environment (IDE), Mini Program Studio with Domain Specific Language (DSL), such as AXML/ACSS/JS, etc. The codes are then compiled and loaded to the wallet apps. Mini programs can run on the wallet app and provide users with a cross-platform and close-to-native experience.

For more information, see [About Mini Program](#).

Getting started

Before you start, make sure you have completed the following prerequisites:

- On-boarding to the Mini Program Platform, where you apply for an account to join a workspace. For more information, see [Getting Started for Merchant On-Boarding](#).
- Assigned with developer roles to a mini program that is created by your admim. For more information, see [Workflow Procedures](#) of the Mini Program Platform product.
- Download the [Mini Program Studio](#) developer tool to write, deploy and debug mini programs.
- Upload the mini program from Mini Program Studio to [Mini Program Platform](#) for testing and publishing.

Refer to the [Quick Start](#) guide for detailed steps.

References

You can find resources with samples and other details to create mini programs. To be specific, you can refer to the following resources available:

- [Framework](#)
- [Component](#)
- [Extended Component](#)
- [JS APIs](#)
- [Open APIs](#)

In addition to the basic APIs, a set of JS APIs and Open APIs can work together to provide capabilities, for example the Payment capability, to users. For more information, see [Capabilities](#).

Document History

2021-05-10 04:19

This document provides you with information on the new or changed documentation. You can quickly see the latest documentation updates.

April, 2021

The following table describes important changes in this release.

Change	Description
Using Mini Program Platform	The Product Guide is now updated with the following:
- Changed topics due to document enhancement:	
- Quality	
- Mini Program types	
- Create Mini Programs	
- Manage Mini Programs	
- New topics due to document enhancement:	
- How to transform an HTML 5 mobile app to an HTML 5 mini program	Developing Mini Programs The Developer's Guide is now updated with the following:
- Added the PLAINTEXT_USER_LOGIN_ID scope in the my.getAuthCode API.	
- Adjusted the USER_LOGIN_ID scope in the my.getAuthCode API.	
- Added the customerBelongsTo parameter for the request in /v2/authorizations/applyToken .	
- Adjusted the loginId and loginIdType for LoginIdInfo in the Data dictionary (for v2) .	

April, 2021

The following table describes important changes in this release.

Change	Description
Using Mini Program Platform	The Product Guide is now updated with the following:
- New video: Customized Analysis	
- New topics: JSAPI	
- Changed topics:	
- Manage mini programs	
- Real-time analysis	

March, 2021

||||---|---|| **Change | Description** || Using Mini Program Platform | The Product Guide is now updated with instructions on the mini program platform features.

The following features are new:

Customized analysis

In addition to the existing default analysis, you can perform the customized analysis by events and funnels. See [Event management and analysis](#) and [Funnel management and analysis](#) for more information. || Developing Mini Programs | Optimize the whole OpenAPI chapter as follows:

- Add the OpenAPI [Idempotency](#) topic.
- [/v1/payments/pay](#), [/v2/payments/pay](#): for the `paymentRequestId` field, add the idempotency description.
- [/v1/payments/refund](#), [/v2/payments/refund](#): for the `refundRequestId` field, add the idempotency description.
- Add the OpenAPIs [Error codes](#) topic; and for all OpenAPIs of the v2 version, adjust the following sections:

- **Result process logic** section

- **Error codes** section

For example, see the API [/v2/authorizations/applyToken](#). || Added the `onUnhandledRejection` function in [Register Mini Program](#).

Added the following topics:

- Added [Obtain basic user information](#).
- Added [Use TradeNO to Pay in Mini Program](#).
- Added [Use OrderStr to Pay in Mini Program](#).
- Added [Use PaymentUrl to Pay in Mini Program](#). || Added the `SEND_MESSAGE` scope in the [my.getAuthCode](#) API.

Added the following JS APIs:

- [my.offAppHide](#)
- [my.offAppShow](#)
- [my.onAppHide](#)
- [my.onAppShow](#)
- [my.offError](#)
- [my.onError](#)
- [my.offUnhandledRejection](#)
- [my.onUnhandledRejection](#)
- [my.openDocument](#)

Added the following extended components:

- [Container](#)
- [Title](#)
- [List-item](#)
- [List-secondary](#)
- [Coupon](#)
- [Terms](#)
- [Tag](#)
- [Mask](#)
- [Guide](#)
- [Avatar](#)
- [Verify Code](#)
- [Long Password](#)
- [Multi Liner](#)
- [Button](#)
- [Am-switch](#)

- [AMRadio](#)
- [Alphabet](#)
- [Loading](#) || Deleted Focus property in the `input` component. |

Feb, 2021

||||---|---|| **Change | Description** || Developing Mini Programs | Optimize the whole OpenAPI [Overview](#) chapter, mainly including the following points:

Request related changes:

- [Request URL](#)
- [Request structure figure](#), where the red asterisk is removed from the diagram
- [Request header](#), where the Agent-Token field is removed because it is not used in Mini Program.

Request related changes:

- [Response structure figure](#), where the red asterisk is removed from the diagram
- [Response header](#), where the traceId field is added. |

Jan, 2021

||||---|---|| **Change | Description** || Using Mini Program Platform | The Product Guide is now updated with instructions on the mini program platform features.

The following features are new:

Two-factor authentication

You can now set the two-factor authentication to protect your account under [Settings](#). See [Two-Factor Authentication](#) for more information.

Customized analysis

In addition to the existing default analysis, you can perform the customized analysis by events. See [Manage Events](#) for more information. || About Mini Program | Added the [Glossary](#)

Added the [FAQs](#) || Design Guidelines | Added [Mini Program design guidelines for user permission requests](#). |

Dec, 2020

||||---|---|| **Change | Description** || Using Mini Program Platform | [Analytics](#)

The dashboard is now available for you to track the data of Unique Visitors (UV) and Page Views (PV). You can see the following two pages:

- [Performance](#)
- [Real-Time Analysis](#)

[Settings](#)

Make sure you save the version so that the changes you make become effective.

Search for a mini program

You can now search for a mini program by the name or ID of the mini program. See [Manage Mini Program](#) for more information. || Developing Mini Programs | The [Developer's Guide](#) is now updated with instructions on mini program development. Developers can view the details and checklist to quickly get started. || The Open API

paths in the [Capabilities](#) topic is updated as Open APIs have different versions.

In addition, user address is added to the following APIs:

- `/v1/customers/user/inquiryUserInfoByAccessToken` and
`/v2/users/inquiryUserInfo`, in the data type of the `userInfo` property,
 add `userAddresses`

- `my.getAuthCode` || The following JSAPIs are added:

- [my.getUpdateManager](#)
- [UpdateManager Overview](#)
- [UpdateManager.applyUpdate](#)
- [UpdateManager.onCheckForUpdate](#)
- [UpdateManager.onUpdateReady](#)
- [UpdateManager.onUpdateFailed](#)
- [my.compressImage](#)

The following JSAPIs are updated:

- [my.request](#): added the error code 2 and changed the original error code 11 to 4.
- [my.getSystemInfo](#): modified the description of the `language` field. || The following Open APIs are created or updated:

Updated: (The followings are [Open APIs](#) for merchants)

- `/v2/users/inquiryUserInfo` and `/v2/messages/sendInbox` : for the `authClientId` property, change from M (mandatory) to O (optional).
 - `/v2/users/inquiryUserInfo` : In the `userInfo` field, add `loginIdInfos` and `contactInfos`.
 - `/v2/payments/pay` : for the `appId` field, change it from O (optional) to M (mandatory)
 - .
 - `/v2/messages/sendInbox` : for the `templates` field, change its type to `Array<ContentTemplate>`
- New: (The followings are new [Open APIs](#) for wallets)
- `/v2/miniprogram/qrcode/create`
 - `/v2/miniprogram/serviceProxy`
 - `/v2/platform/message/send`

Nov, 2020

||||---|---|| **Change | Description** || Using Mini Program Platform | A [video](#) is available for you to quickly learn the product features.

The following new features are available

Mini Program Type

- Default (DSL): Native mini program
- PWA (HTML5): Progressive Web App (PWA)

Settings:

- Define the Copyright Notice
- Define the email SMTP port and enable the SSL connection || Developing Mini Programs | The following JSAPIs are updated:
- [my.prompt](#): for Android the default value of `align` is changed from **left** to **center**
- [my.uploadFile](#): update the description of `fileType`

The following JSAPIs are new:

Location

- [my.chooseLocation](#)
- [my.openLocation](#)

Share

- [my.showSharePanel](#)

- onShareAppMessage

The Map component is added with the following JS APIs:

- my.createMapContext(mapId)
- MapContext.clearRoute
- MapContext.gestureEnable
- MapContext.getCenterLocation
- MapContext.moveToLocation
- MapContext.showRoute
- MapContext.showsCompass
- MapContext.updateComponents || Developing Mini Programs | For the following types of Open APIs, `payments-core`, `payments-standard`, `oauths-standard`, `miniprogram`, and `customers`, the new version `1.2.x` of API Specifications is provided, based on which, all APIs path starts from `v2`. For example, `/v2/payments/pay`.

Except for the version upgrade, compared with the earlier version, there are lots of interface property changes. For details, see the following Open APIs section.

Open APIs

For details of each Open API, see [Open APIs](#)

Nov 27, 2020

||||---|---|| **Change | Description** || /v2/authorizations/revoke | - Rename `/v2/authorizations/cancelToken` to `/v2/authorizations/revoke`
 - For the `authClientId` property, change its data type from `String (32)` to `String (128)` ||
`/v2/authorizations/applyToken`
`/v2/authorizations/revoke`
`/v2/users/inquiryUserInfo`
`/v2/messages/sendInbox` | For the `authClientId` property, change its data type from `String (32)` to `String (128)` || API fundamentals | Update the **Request URL** section || Data dictionary | Editorial changes (e.g. remove the yellow and red display) |

Nov 23, 2020

The following changes are applied for Mini Programs to align with AMS standard.

||||---|---|| **Change | Description** || /v2/authorizations/applyToken | In the request body, change code to `authCode` || /v2/authorizations/cancelToken | In the request body, add the `authClientId` property || /v2/users/inquiryUserInfo | - Change the API path from `/v2/customers/user/inquiryUserInfoByAccessToken` to `/v2/users/inquiryUserInfo`
 - In the Response, change the `OpenUserInfo` object name to `User` ||
`/v2/messages/sendInbox` | Change the API path from `/v2/customers/message/sendInboxByAccessToken` to `/v2/messages/sendInbox` ||
`/v2/payments/pay` | In the request body:
 - Move the `env` object to the `Order` object
 - Delete the `merchantMCC` property || `/v2/payments/refund` | In the request body, delete the `order` object || Data Dictionary | Change the `OpenUserInfo` object name to `User` || In the `OpenUserInfo` object, change `birthdate` to `birthDate` || In the `PaymentMethod`

object, change extendMetaData to paymentMethodMetaData || In the Order object, change the data type of goods to Array<Goods> || In the Address object: remove the duplicated label property |

Nov 19, 2020

- For the payments OpenAPI, the OpenAPI specification is upgraded to v1.2.4.

||||---|---|| **Change | Description** || /v2/payments/pay | In the response body, change from the ActionForm object to the RedirectActionForm object || Data Dictionary | Add the RedirectActionForm object || Remove the env property from the Order object |

Nov 17, 2020

- For the payments OpenAPI, the OpenAPI specification is upgraded to v1.2.3.

||||---|---|| **Change | Description** || /v2/payments/pay | Update the description of the productCode property || Update the paymentFactor object in the API request body as follows:

Add the following properties:

- needSurcharge
- isDeferredPayment
- needCheckCompliance
- needOtpVerification
- isCrossborderSettlement
- inStorePaymentScenario

Delete the following properties:

- isOrderCode
- isPaymentCode
- isAgreementPay || Add the env and merchantMCC properties in the API request body ||

- For the authorizations OpenAPI, the OpenAPI specification is upgraded to v1.2.1.

||||---|---|| **Change | Description** || /v2/authorizations/applyToken | - remove the referenceClientId property from the request body
- For the authClientId property, change from M to O || /v2/authorizations/cancelToken | remove the authClientId property from the request body |

Nov 5, 2020

- For the customers OpenAPI, the OpenAPI specification is upgraded to 1.2.0

||||---|---|| **Change | Description** || /v2/customers/message/sendInboxByAccessToken | Add this new API || /v2/customers/user/inquiryUserInfoByAccessToken | - Add the authClientId property
- In the Response sample, modify the userName property by adding the firstName and lastName sub-properties |

- For the miniprogram OpenAPI, the OpenAPI specification is upgraded to 1.2.0

||||---|---|| **Change | Description** || /v2/miniprogram/message/send | Add this new API |

- For the authorizations OpenAPI, theOpenAPI specification is upgraded to 1.2.0

||||---|---|| **Change | Description** || /v2/authorizations/applyToken | - In the Sample, add the description: The access token should be kept in the merchant server only, which means that it should not be returned to the Mini Program.

- Add the authClientId property
- Rename the authCode property to Code || /v2/authorizations/cancelToken | Add the following property:
- authClientId |

- For the payments OpenAPI, theOpenAPI specification is upgraded to 1.2.0, 1.2.1, and 1.2.2

||||---|---|| **Change | Description** || /v2/payments/pay | Delete the following properties:

- partnerId
- paymentAuthCode
- paymentOrderTitle
- paymentToken
- delete the isCashierPayment field of the paymentFactor property

Add the following properties:

- salesCode
- order (replace the original `extraParams` with order)

Rename the following properties

- from paymentReturnUrl to paymentRedirectUrl
- from paymentMethods to paymentMethod

Other changes:

- productCode: change the description || /v2/payments/inquiryPayment | Delete the following properties:

- paymentFailReason
- authExpiryTime || /v2/payments/notifyPayment | Delete the following properties:
- partnerId
- paymentStatus
- paymentFailReason

Add the following properties:

- paymentResult || /v2/payments/refund | Delete the following properties:
- partnerId

Add the following properties:

- order || /v2/payments/inquiryRefund | Delete the following property:
- partnerId |

- For others

||||---|---|| **Change | Description** || Data dictionary | - Change the EnvInfo object to Env

- Change the birthday property to birthdate
- For the Order object:
- Add the Merchant and env properties
- Change the description for the orderAmount property
- Modify its following "required" properties: referenceOrderId, orderDescription, orderAmount, Merchant
- For the Result object, change all properties from M (mandatory) to O (optional) || API

Fundamental | - Add more description for the **Request URL**

- In the **Response header** section, add details about the response structure || Call an API |

Add a new chapter, where signing a request and validating the response signature are documented |

Oct, 2020

The following table describes important changes in each release since Oct, 2020.

|||| --- | --- || **Change | Description** || Getting Started | [Getting Started for Merchant On-Boarding](#) is now available for merchants to quickly create a developer workspace. ||

Using Min Program Platform | The following new features are available:

- [QR Code for Testing](#)
- [Whitelist for Gray Box Testing](#)

In addition, the product user guide is updated for you to easily use the Mini Program Platform. The following new topics are added for you to see the detailed features:

- [Manage Mini Programs](#)
- [Manage Workspace](#)
- [Authorization](#)
- [Approvals](#)
- [Manage Apps](#)
- [Manage Feedback](#)
- [Members](#)
- [Features](#)

For more information, see these guides under [Using Mini Program Platforms](#). ||

Developing Mini Programs | A new API [my.chooseFileFromDisk](#) is now available for you to choose a file to upload. You can also view the details of the file or delete the file you have added.

The Appx is now updated to 1.24.6 version. You need to make sure you use the Appx with 1.24.6 or higher versions in order to use the following APIs:

- [my.getSiteInfo](#)
- [my.signContract](#)

The [my.request](#) API is updated with error code descriptions when the server or H5 domain whitelist is not configured.

For more information, see these API references under [Developing Mini Program > References > JSAPI](#).

The [Capabilities](#) description is now available for you to see the API capabilities:

- [User Information Capability](#)
- [Payment Capability](#)

For more information, see [Developing Mini Program > Working with Mini Program > Capabilities](#). || User Experience Design Guidelines | The design guideline for food and beverage industry is now available. You can use the guidelines to design the industry-specific mini programs. |

Sept, 2020

The following table describes important changes in each release since Sept, 2020.

||||---|---|| **Change | Description** || Getting Started | The new topic is introduced to help you quickly start with the Mini Program Platform. || App Container | A feature description of App Container is now added. || Structural Changes | The structure of documentation is updated. You can quickly get the information that you need with an organized structure below:

- *About Mini Program*: See the introduction.
- *Getting Started*: Quickly getting started with
- *Developing Min Program*: Get the developer guide and references, such as JSAPIs and Open APIs.

- *Using Min Program Platform*: See the user manual of the platform product.
 - *User Experience Design Guidelines*: Check the design details and guidelines.
 - *Document History*: See what's new in the latest release and the document history.
 Using *Min Program Platform* | The product user guide is updated for you to easily use the Mini Program Platform. The following new topics are added for you to see the detailed features:

- *Manage Mini Programs*
- *Manage workspace*
- *Authorization*
- *Approvals*
- *Manage Apps* || Open API | The Open API reference /v1/payments/pay is updated with a request parameter appId. You can get the mini program ID, based on which you can conduct marketing campaigns. |

Aug, 2020

The following table describes important changes in each release since Aug, 2020.

||||---|---|| **Change | Description** || Mini Program Studio | Editorial changes to the developer tool. || Mini Program Development Platform | The platform product guide is now available with the following features:

- Overview topic
- Member roles description and authorizations for each role
- Workflows and detailed explanation on the procedures
- Quality for each mini program in the workspace
- Analytics to see a visualized form of data

See the latest guides under ***Getting Started => Working with Mini Program Platform***.

The **settings** feature is now available for workspace admins on the platform. Check the detailed description in the product guide. || API References | The movable-view and movable-area View Containers are added to the Components.

The following APIs are added:

- my.hideBackHome
- Tab bar FAQ
- my.watchShake
- my.onAccelerometerChange
- my.offAccelerometerChange
- my.onCompassChange
- my.offCompassChange
- my.onMemoryWarning
- my.offMemoryWarning

- my.getPhoneNumber

See the latest references under **Getting Started => Working with Mini Program => References.** |

Documentation {#documentation}

Documentation

The Mini Program technology is the answer to rapid mobile app development. Mini Programs are sub-applications that run inside the mobile app. You can access various services and features on Mini Programs without the need to install additional applications. Discover guides, tutorials and references to quickly get started.

Quick Start

Learn how to release your first Mini Program:

- Apply for an account in the Mini Program Platform
- Create a workspace and assign roles for admins (tenants) and developers
- Create a Mini Program in the workspace
- Build the Mini Program in the developer console
- Submit the Mini Program for approval

Error codes {#error-codes}

Last updated: 2021-05-09

Path: miniprogram_gcash

Error codes

2021-05-09 18:43

If an error occurs when you call an API, an error response is returned, where [the result object](#) indicates the error code (`resultCode`) and error message (`resultMessage`). You can use error codes and messages to troubleshoot issues.

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- [API-specific error codes](#): are dedicated to a specific OpenAPI.

Common error codes

The following table lists all common error codes for Mini Program OpenAPIs. If you do not find an error code in the following table, it means that the error code is not common, but dedicated to a specific OpenAPI (see the following [API-specific error codes](#) section).

	resultCode	resultMessage	resultStatus	Action to do
PROCESS_FAIL	A general business failure occurred. Do not retry.	F	Human intervention is usually needed. It is recommended that you contact Mini Program Technical Support to troubleshoot the issue.	PARAM_ILLEGAL
				Illegal parameters.

For example, non-numeric input, invalid date. | F | Check and verify whether the request fields (including the header fields and body fields) of the current API are correct and valid.

For details, see the specific API specification, for example, [the applyToken API specification](#). || INVALID_API | The called API is invalid or not active. | F | Check whether the current API name is used by mistakes when the API is called. || ACCESS_DENIED | Access is denied | F | Need to check the resultMessage of the current API specification for details. For example, [the applyToken API specification](#). || REQUEST_TRAFFIC_EXCEED_LIMIT | The request traffic exceeds the limit. | F | - The party that calls APIs needs to reduce the API calling frequency, or - The API service provider needs to increase the traffic limit or threshold. || EXPIRED_ACCESS_TOKEN | The access token is expired. | F | Renew the access token by calling the applyToken API ([/v1/authorizations/applyToken](#) or [/v2/authorizations/applyToken](#)) || UNKNOWN_EXCEPTION | An API calling is failed, which is caused by unknown reasons. | U | Trying to re-call the API might help to resolve the issue. |

API-specific error codes

For error codes that are dedicated to a specific API, see the **Result** section in each API specification, for example, [the applyToken API specification](#).

Error codes {#error-codes}

Last updated: 2022-07-07

Path: miniprogram_gcash

Error codes

2022-07-07 17:08

If an error occurs when you call an API, an error response is returned, where the object `result` indicates the error code (`resultCode`) and error message (`resultMessage`). You can use error codes and messages to troubleshoot issues.

Error codes are usually classified into the following categories:

- [Common error codes](#): are common for all Mini Program OpenAPIs.
- [API-specific error codes](#): are dedicated to a specific OpenAPI.

Common error codes

The following table lists all common error codes for Mini Program OpenAPIs. If you do not find an error code in the following table, it means that the error code is not common, but dedicated to a specific OpenAPI.

		Error code	Result status	Error message	Further action
	---	PROCESS_FAIL	F	A general business failure occurred. Do not retry. Contact technical support to troubleshoot the issue.	PARAM_ILLEGAL F Illegal parameters. For example, non-numeric input, invalid date. Check and verify whether the request fields (including the header fields and body fields) of the current API are correct and valid. For example, /v1/authorizations/applyToken . INVALID_API F The called API is invalid or not active. Check whether the current API name is used by mistakes when the API is called. ACCESS_DENIED F Access is denied Need to check the <i>resultMessage</i> of the current API specification for details. For example, /v1/authorizations/applyToken . REQUEST_TRAFFIC_EXCEED_LIMIT F The request traffic exceeds the limit. - The party that calls APIs needs to reduce the API calling frequency, or - The API service provider needs to increase the traffic limit or threshold. UNKNOWN_EXCEPTION U An API calling is failed, which is caused by unknown reasons. Trying to recall the API might help to resolve the issue.

API-specific error codes

For error codes that are dedicated to a specific API, see the **Error codes** section in each API specification, for example, [/v1/authorizations/applyToken](#).

Event Introduction {#event-introduction}

Last updated: 2021-05-10

Path: miniprogram_gcash

Event Introduction

2021-05-10 03:43

What is event?

- Event is the way of communication from the view layer to logic layer.
- The event feeds user behaviors back to logic layer for handling.

- Event can be bound to component. When the trigger condition happens, the corresponding event handler is executed in the logic layer.
- Event object can carry additional information, such as id, dataset and touches.

Usage

If you want to bind an event handler in a component, for example onTap, you need to define the onTap function in the Page object in the relative .js file.

copy

```
<view id="tapTest" data-hi="Mini Program" onTap="tapName">
  <view id="tapTestInner" data-hi="Mini Program Inner">
    Click me!
  </view>
</view>
```

In the relative Page, tapName should be defined to handle the event, and the parameter of the function is event.

copy

```
Page({
  tapName(event) {
    console.log(event);
  },
});
```

The console output

copy

```
{
  "type": "tap",
  "timeStamp": 1550561469952,
  "target": {
    "id": "tapTestInner",
    "dataset": {
      "hi": "Mini Program"
    },
    "targetDataset": {
      "hi": "Mini Program Inner"
    }
  },
  "currentTarget": {
    "id": "tapTest",
    "dataset": {
      "hi": "Mini Program"
    }
  }
}
```

In the use of components (basic component, extended component and custom component), the events available in the component depends on the support of the component itself. The supported events are specified clearly in the document of the specific component.

Event Type

The events fall into bubbling events and non-bubbling events:

1. **Bubbling events:** With `on` as the prefix, when the event of a component is triggered, the event is transferred to parent node.
2. **Non-bubbling events:** With `catch` as the prefix, when the event of a component is triggered, the event is not transferred to parent node.

The event binding is written is the same as component attribute in form of `key, value`.

- The key starts with `on` or `catch`, followed by event type, such as `onTap` and `catchTap`.
- The value is a string corresponding to the name of function defined in the Page. Error is reported when no trigger event exists.

copy

```
<view id="outer" onTap="handleTap1">
  view1
  <view id="middle" catchTap="handleTap2">
    view2
    <view id="inner" onTap="handleTap3">
      view3
    </view>
  </view>
</view>
```

In the above codes, clicking `view3` triggers `handleTap3` and `handleTap2` (because tap event bubbles to `view2` while `view2` prevents tap event bubbling and does not transfer to parent node). Clicking `view2` triggers `handleTap2`; clicking `view1` triggers `handleTap1`.

All bubbling events:

||||---|---|| **Type | Trigger condition** || touchStart | Start of touch action. || touchMove | Move after touch. || touchEnd | End of touch action. || touchCancel | Touch action interrupted, such as incoming call and pop-up. || tap | Touch and leave immediately. || longTap | Touch and leave after 500ms. |

Event Introduction

2022-07-03 18:44

What is event?

- Event is the way of communication from the view layer to logic layer.
- The event feeds user behaviors back to logic layer for handling.
- Event can be bound to component. When the trigger condition happens, the corresponding event handler is executed in the logic layer.
- Event object can carry additional information, such as id, dataset and touches.

Usage

If you want to bind an event handler in a component, for example `onTap`, you need to define the `onTap` function in the Page object in the relative `.js` file.

copy

```
<view id="tapTest" data-hi="Mini Program" onTap="tapName">
  <view id="tapTestInner" data-hi="Mini Program Inner">
    Click me!
  </view>
</view>
```

In the relative Page, `tapName` should be defined to handle the event, and the parameter of the function is `event`.

copy

```
Page({
  tapName(event) {
    console.log(event);
  },
});
```

The console output

copy

```
{
  "type": "tap",
  "timeStamp": 1550561469952,
  "target": {
    "id": "tapTestInner",
    "dataset": {
      "hi": "Mini Program"
    },
    "targetDataset": {
      "hi": "Mini Program Inner"
    }
  },
  "currentTarget": {
    "id": "tapTest",
    "dataset": {
      "hi": "Mini Program"
    }
  }
}
```

In the use of components (basic component, extended component and custom component), the events available in the component depends on the support of the component itself. The supported events are specified clearly in the document of the specific component.

Event Type

The events fall into bubbling events and non-bubbling events:

1. **Bubbling events:** With `on` as the prefix, when the event of a component is triggered, the event is transferred to parent node.
2. **Non-bubbling events:** With `catch` as the prefix, when the event of a component is triggered, the event is not transferred to parent node.

The event binding is written is the same as component attribute in form of `key, value`.

- The key starts with `on` or `catch`, followed by event type, such as `onTap` and `catchTap`.
- The value is a string corresponding to the name of function defined in the Page. Error is reported when no trigger event exists.

copy

```
<view id="outer" onTap="handleTap1">
  view1
  <view id="middle" catchTap="handleTap2">
    view2
    <view id="inner" onTap="handleTap3">
      view3
    </view>
```

```
</view>
</view>
```

In the above codes, clicking view3 triggers handleTap3 and handleTap2 (because tap event bubbles to view2m while view2 prevents tap event bubbling and does not transfer to parent node). Clicking view2 triggers handleTap2; clicking view1 triggers handleTap1.

All bubbling events:

```
||||---|---|| Type | Trigger condition || touchStart | Start of touch action. || touchMove  
| Move after touch. || touchEnd | End of touch action. || touchCancel | Touch action  
interrupted, such as incoming call and pop-up. || tap | Touch and leave immediately. ||  
longTap | Touch and leave after 500ms. |
```

Event Object {#event-object}

Last updated: 2021-05-09

Path: miniprogram_gcash

Event Object

2021-05-09 18:43

When the component triggers the event, the event handler bounded with the logic layer receives an event object.

BaseEvent

BaseEvent basic event object attribute list:

```
|||||---|---|---|| Property | Type | Description || type | String | Event type. ||  
timeStamp | Integer | Event generated timestamp. || target | Object | Attribute value set of  
the component triggering the event. |
```

Type

Type: Event type

Timestamp

timeStamp: Event generated timestamp

Target

dataset define data in component, and the data is transferred via event to the logic layer. Start with **data-** and use hyphen – to connect multiple words which must be in lower case (upper case automatically converted into lower case). For example, the **data-element-type** will eventually convert the hyphen into hump **elementType** in the **event.target.dataset**.

Sample codes:

copy

```
<view data-alpha-beta="1" data-alphaBeta="2" onTap="bindViewTap">
DataSet Test </view>
```

copy

```
Page({
  bindViewTap:function(event){
    event.target.dataset.alphaBeta === 1 // - Will convert into hump
writing
    event.target.dataset.alphabeta === 2 // Upper case converted into
lower case
  }
})
```

Target: source component object that triggers the event, attribute list:

	Property	Type	Description
id	String	Event source component id.	
tagName	String	Current component type.	
dataset	Object	Set of custom attributes starting with data- on component bound with the event.	
targetDataset	Object	Set of custom attributes starting with data- on component actually triggering the event.	

CustomEvent

CustomEvent custom event object attribute list (inherited from BaseEvent)

	Property	Type	Description
detail	Object	Additional information.	

Detail

Data carried in custom event The form component event carries user entry information. For example, the switch component, when **onChange** trigger, gets user selected status value via **event.detail.value**. The media error event carries error information. **For details, see the component document event description.**

TouchEvent

TouchEvent touch event object attribute list (inherited from BaseEvent)

--- --- ---	Property	Type	Description
touches	Array	Array of touch point information staying current on the screen.	
changedTouches	Array	Array of touch point information changing currently.	

The touches is an array. Each of its elements is a Touch object (the touches carried in the **canvas** touch event is the CanvasTouch array), indicating the touch point staying on the screen.

changedTouches data format is the same as touches. Indicates changing touch point, such as from none to start (touchstart), location change (touchmove), from touch to end (touchend, touchcancel).

Touch Object

--- --- ---	Property	Type	Description
identifier	Number	Touch point identifier.	
pageX, pageY	Number	Distance to the document upper-left corner, the upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis.	
clientX, clientY	Number	Distance to the displayable region of page (screen except for navigation bar), the upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis.	

CanvasTouch Object

--- --- ---	Property	Type	Description
identifier	Number	Touch point identifier.	
x, y	Number	Distance to the Canvas upper-left corner, the Canvas upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis.	

Sample

Take touchMove event as an example, when user touch the following component.

copy

```
<view class="move-view" onTouchMove="touchMoveHandle">
</view>
```

The touchMoveHandle will be invoked in the page, the TouchEvent will act as the parameter.

copy

```
Page({
  touchMoveHandle(e){
    console.log(e)
  }
});
```

The console output

copy

```
{
  "type": "touchMove",
  "timeStamp": 1562241425847,
  "target": {
    "targetDataset": {},
    "tagName": "view",
    "dataset": {},
    "offsetLeft": 0,
    "offsetTop": 0
  },
  "currentTarget": {
    "tagName": "view",
    "dataset": {},
    "offsetLeft": 0,
    "offsetTop": 0
  },
  "touches": [
    {
      "clientX": 49.69140625,
      "clientY": 54.1640625,
      "identifier": 0,
      "pageX": 49.69140625,
      "pageY": 54.1640625
    }
  ],
  "changedTouches": [
    {
      "clientX": 49.69140625,
      "clientY": 54.1640625,
      "identifier": 0,
      "pageX": 49.69140625,
      "pageY": 54.1640625
    }
  ]
}
```

Event Object

2022-07-03 18:44

When the component triggers the event, the event handler bounded with the logic layer receives an event object.

BaseEvent

BaseEvent basic event object attribute list:

||||| --- | --- | --- || **Property** | **Type** | **Description** || type | String | Event type. ||
 timeStamp | Integer | Event generated timestamp. || target | Object | Attribute value set of
 the component triggering the event. |

Type

Type: Event type

Timestamp

timeStamp: Event generated timestamp

Target

dataset define data in component, and the data is transferred via event to the logic layer. Start with data- and use hyphen – to connect multiple words which must be in lower case (upper case automatically converted into lower case). For example, the data-element-type will eventually convert the hyphen into hump elementType in the event.target.dataset.

Sample codes:

copy

```
<view data-alpha-beta="1" data-alphaBeta="2" onTap="bindViewTap">
DataSet Test </view>
```

copy

```
Page({
  bindViewTap:function(event){
    event.target.dataset.alphaBeta === 1 // - Will convert into hump
writing
    event.target.dataset.alphabeta === 2 // Upper case converted into
lower case
  }
})
```

Target: source component object that triggers the event, attribute list:

Property	Type	Description
id	String	Event source component id.
tagName	String	Current component type.
dataset	Object	Set of custom attributes starting with data- on component bound with the event.
targetDataset	Object	Set of custom attributes starting with data- on component actually triggering the event.

CustomEvent

CustomEvent custom event object attribute list (inherited from BaseEvent)

Property	Type	Description
detail	Object	Additional information.

Detail

Data carried in custom event. The form component event carries user entry information. For example, the switch component, when onChange trigger, gets user selected status value via event.detail.value. The media error event carries error information. **For details, see the component document event description.**

TouchEvent

TouchEvent touch event object attribute list (inherited from BaseEvent)

Property	Type	Description
touches	Array	Array of touch point information staying current on the screen.
changedTouches	Array	Array of touch point information changing currently.

The touches is an array. Each of its elements is a Touch object (the touches carried in the **canvas** touch event is the CanvasTouch array), indicating the touch point staying on the screen.

changedTouches data format is the same as touches. Indicates changing touch point, such as from none to start (touchstart), location change (touchmove), from touch to end (touchend, touchcancel).

Touch Object

Property	Type	Description
identifier	Number	Touch point identifier.
pageX, pageY	Number	Distance to the document upper-left corner, the upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis.
clientX, clientY	Number	Distance to the displayable region of page (screen except for navigation bar), the upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis.

CanvasTouch Object

||||| --- | --- | --- || **Property** | **Type** | **Description** || identifier | Number | Touch point identifier. || x, y | Number | Distance to the Canvas upper-left corner, the Canvas upper-left corner as origin, horizontal direction as x axis and vertical direction as y axis. |

Sample

Take touchMove event as an example, when user touch the following component.

copy

```
<view class="move-view" onTouchMove="touchMoveHandle">
</view>
```

The touchMoveHandle will be invoked in the page, the TouchEvent will act as the parameter.

copy

```
Page({
  touchMoveHandle(e){
    console.log(e)
  }
});
```

The console output

copy

```
{
  "type": "touchMove",
  "timeStamp": 1562241425847,
  "target": {
    "targetDataset": {},
    "tagName": "view",
    "dataset": {},
    "offsetLeft": 0,
    "offsetTop": 0
  },
  "currentTarget": {
    "tagName": "view",
    "dataset": {},
    "offsetLeft": 0,
    "offsetTop": 0
  },
  "touches": [
    {
      "clientX": 49.69140625,
      "clientY": 54.1640625,
      "identifier": 0,
      "pageX": 49.69140625,
```

```

    "pageY": 54.1640625\
  }\
],
"changedTouches": [
  {
    "clientX": 49.69140625,\
    "clientY": 54.1640625,\
    "identifier": 0,\
    "pageX": 49.69140625,\

Event management and analysis {#event-management-and-analysis}

Last updated: 2022-07-07

Path: miniprogram_gcash

Event management and analysis

2022-07-07 17:08

This topic introduces the event management and analysis functions that are provided by the Mini Program platform. To learn more about how to manage and analyze events, see [How to customize your analysis](#).

Event management

What are events?

Events are triggered when users interact with your mini programs. When an event is triggered, data are collected and you can analyze user behavior. Based on the data analysis, you can visualize the performance of your mini programs and get continuous feedback on how to improve your product strategy.

For example, by adding events for a shopping mini program, you can identify the most popular products among your users. This information can then inform your strategy on developing similar products that will convert users.

What are event fields?

Data of an event consist of default fields and customized fields. The data of default fields are collected from systems on user devices, such as location and device type. The data of customized fields are collected from user actions, such as the act of clicking a product details page.

Under **My Analysis > Manage Event > Field List**, you can view the list of default fields and customized fields.

Currently, the field type supports integer and string.

Features

You can manage events in the following ways:

- View the event and field list

On the **Manage Event** page, you can view all events and fields. If no event is available, you can click the **+ New Event** button to create an event.

- Define an event

You can define an event by specifying the event name and data reporting method of the event. Currently, Data Reporting by Self-Defined Actions is supported.

- Publish an event

After confirming all required information of an event, you can publish the event. Once an event is live, it will start collecting data immediately.

- Modify an event

You can modify the event configuration regardless of whether the event is published or not. If a published event is modified, you must publish the event again to update the changes.

- Delete an event

You can delete the event. This action cannot be reversed, and a deleted event cannot be republished. However, you can create a new event with the same event name and configurations. In this way, you can see the data collected previously under **My Analysis** and continue to use this event to collect data. If either the event name or the configuration is inconsistent with the original event, all the data collected previously won't be displayed under **My Analysis**.

Event analysis

What is event analysis?

Event analysis is the customized analysis based on events. By selecting the required analysis conditions, you can see the data that reflects user's behavior, such as count of placing orders.

What are analysis conditions?

During the event analysis, the following analysis conditions might be involved:

- **Event:** The event to be analyzed.
- **Metric:** The dimension that you want to analyze for the event. For all events, you can select the following two default metrics:
 - Page view: A default metric that indicates the number of times the page is viewed.
 - Unique visitor: A default metric that indicates the number of users who view the page. One user with multiple views is still counted as one unique visitor.

In addition to these two default metrics, you can also select customized metrics, which are the fields defined in the event, for analysis.

- **Filter:** Filter conditions of the customized metrics that are selected. For example, the metric *productPrice* is selected and you can set the filter condition as *productPrice* equal to 10.
- **Date Range:** The period when events are triggered.
- **Time Granularity:** Currently the time granularity supports daily and hourly.

Features

The event analysis function enables you to do the following:

- Set conditions for the event analysis

You can select an event for data analysis and set the following conditions:

- Metric
- Filter conditions of the metric
- Date range
- Time granularity
- View analysis result

You can view the analysis result in the form of table or graph.

FAQs {#faqs}

Last updated: 2021-05-10

Path: miniprogram_gcash

FAQs

2021-05-10 13:12

Get answers to common questions about mini programs.

Mini program platform

Why does the request parameter error occur when I modify the mini program slogan and name?

The local CDN is not stable when the mini program image is uploaded. You can upload a new image and update the mini program information again.

Why do wallet admins not receive the notification of the approval request when mini program developers release mini programs in the sandbox environment?

Approval is required only when the mini program is released in the production environment. In other environments the mini program release is approved automatically.

Component

Why does the *No Privilege* error occur when using the WebView component?

You can try to solve the problem by the following checklist:

- Add required H5 domains to the whitelist under **Mini Program > Configuration > H5 Domain Whitelist**.
- Release the mini program in your environment, which can be sandbox environment, test environment, or development environment. Otherwise, the updated configuration does not take effect.

If you can't solve the problem with the provided solution, contact the technical support team of your site.

API

Why does the *JSAPI call denied* error occur when calling the my.request JSAPI?

You can try to solve the problem by the following checklist:

- Add the required server domains to the whitelist under **Mini Program > Configuration > Server Domain Whitelist**.
- Release the mini program in the sandbox environment, test environment, or development environment. Otherwise, the updated configuration does not take effect.
- Check whether the JSAPI is private. If the called JSAPI is private, get the permission to call the JSAPI from the wallet first.

Why is the error code 4006 returned when I call the getAuthCode JSAPI?

This error occurs because of the incorrect configurations at the merchant server side. You need to contact the server end developer for help.

Why does the *No privilege* error occur when I call some JSAPIs?

Check whether the JSAPI is private. If the called JSAPI is private, get the permission to call the JSAPI from the wallet first.

IDE

What's the maximum size of the mini program when uploading mini programs from IDE to the mini program platform?

The maximum size limit at the server side is 8MB. However, it's difficult to define the size limit of the source code because many factors impact the size of the packaged source code, such as image compressing. Currently the package for debugging on real devices has the maximum size. The file is stored in the directory as highlighted in the following figure. Except for this file, generally all files that are no more than 8MB can be uploaded.

Basic information

Does the mini program support SVG and gradient?

Yes. Progressive web apps (also referred as H5) and the image component in native mini programs support SVG. Progressive web apps support gradient. SVG is used in the user authentication, such as sliding the verification picture.

Features {#features}

Last updated: 2022-07-07

Path: miniprogram_gcash

Features

2022-07-07 17:08

You can define specific features according to your business requirements, in addition to the payment and user information capabilities that are available by default. For more information, see [Capabilities](#).

Features

You can perform the following activities:

- Create new features with the following details:
 - Feature Name (Mandatory)
 - Activation Access (Mandatory)
- Direct Access: You can have access to this feature immediately, without further requirements.
- Activation Needed: You need to fulfill the activation requirements before you can have access to this feature.
- Select APIs to construct the content of the feature

For more information on how APIs can combine to form a capability, see [Capabilities](#).

- View features in a list
- Change the following details of a feature
 - API Name

Choose the API name, you can see the details of the API

You can have a overview of the usage of this API, such as the API description, scenario, wallet name, security level, and so on.

Under the Info tab, you get basic information of the APIs, such as the input parameters, output parameters, sample codes, and error codes.

Under the Version History tab, , you can see the version and status of the JSAPI.

- Latest Version
- Created by
- Edited Date
- Track the version history of a feature

File reference {#file-reference}

Last updated: 2022-07-04

Path: miniprogram_gcash

File reference

2022-07-04 03:44

The axml provides two file reference methods: `import` and `include`

import

The import can load a defined template.

For example, a template named `item` was defined in the `item.axml`.

copy

```
<!-- item.axml -->
<template name="item">
    <text>{{text}}</text>
</template>
```

When `item.axml` is referenced in `index.axml`, the `item` template can be used.

copy

```
<import src="../item.axml"/>
<template is="item" data="{{text: 'forbar'}}"/>
```

The import has the concept of action scope. Only the template defined in the target file is imported, but the one imported into the target file is not imported.

For example, C import B, B import A, in C it is possible to use the template defined in B, in B it is possible to use the template defined in A, but in C it is impossible to use the template defined in A.

copy

```
<!-- a.axml -->
<template name="A">
    <text> A template </text>
</template>
```

copy

```
<!-- b.axml -->
<import src=".//a.axml"/>
<template name="B">
    <text> B template </text>
</template>
```

copy

```
<!-- c.axml -->
<import src=".//b.axml"/>
<template is="A"/> <!-- Note: cannot use import A -->
<template is="B"/>
```

Note that the sub-node of template can be one only. For example:

Allowed example:

copy

```
<template name="x">
    <view />
</template>
```

Disallowed example:

copy

```
<template name="x">
    <view />
    <view />
</template>
```

include

The include may introduce the whole codes except for `<template/>`, which is equivalent to copy to the include position.

Code sample:

copy

```
<!-- index.axml -->
<include src=".//header.axml"/>
<view> body </view>
<include src=".//footer.axml"/>
```

copy

```
<!-- header.axml -->
<view> header </view>
```

copy

```
<!-- footer.axml -->
<view> footer </view>
```

Introduction Path

The template introduction path supports relative path, absolute path and third-party module loaded from node_modules directory.

copy

```
<import src=".//a.axml"/> <!-- relative path -->
<import src="/a.axml"/> <!-- absolute path of the project -->
<import src="third-party/x.axml"/> <!-- path of the third-party npm
package -->
```

Source:

File reference {#file-reference}

Last updated: 2021-05-09

Path: miniprogram_gcash

File reference

2021-05-09 18:43

The axml provides two file reference methods: `import` and `include`

import

The import can load a defined template.

For example, a template named item was defined in the item.axml.

copy

```
<!-- item.axml -->
<template name="item">
  <text>{{text}}</text>
</template>
```

When item.axml is referenced in index.axml, the item template can be used.

copy

```
<import src=".item.axml"/>
<template is="item" data="{{text: 'forbar'}}"/>
```

The import has the concept of action scope. Only the template defined in the target file is imported, but the one imported into the target file is not imported.

For example, C import B, B import A, in C it is possible to use the template defined in B, in B it is possible to use the template defined in A, but in C it is impossible to use the template defined in A.

copy

```
<!-- a.axml -->
<template name="A">
  <text> A template </text>
</template>
```

copy

```
<!-- b.axml -->
<import src=".a.axml"/>
<template name="B">
  <text> B template </text>
</template>
```

copy

```
<!-- c.axml -->
<import src=".b.axml"/>
<template is="A"/> <!-- Note: cannot use import A -->
<template is="B"/>
```

Note that the sub-node of template can be one only. For example:

Allowed example:

copy

```
<template name="x">
  <view />
</template>
```

Disallowed example:

copy

```
<template name="x">
  <view />
  <view />
</template>
```

include

The include may introduce the whole codes except for <template/>, which is equivalent to copy to the include position.

Code sample:

copy

```
<!-- index.axml -->
<include src="../header.axml"/>
<view> body </view>
<include src="../footer.axml"/>
```

copy

```
<!-- header.axml -->
<view> header </view>
```

copy

```
<!-- footer.axml -->
<view> footer </view>
```

Introduction Path

The template introduction path supports relative path, absolute path and third-party module loaded from node_modules directory.

copy

```
<import src="../a.axml"/> <!-- relative path -->
<import src="/a.axml"/> <!-- absolute path of the project -->
<import src="third-party/x.axml"/> <!-- path of the third-party npm package -->
```

Filter

Property	Description	Type	Default	Required
show	Show or not, optional, show hide.	String	hide	No
max	Maximum choices, 1 for single choice.	Number	10000	No
onChange	Submit selection callback upon multiple choice.	(e: Object) => void		No

Filter-item

Property	Description	Type	Default	Required
className	Custom style.	String	No	
value	Value.	String	Yes	
id	Custom identifier.	String	No	
selected	Selected by default.	Boolean	false	No
onChange	Submit selection callback upon single choice.	(e: Object) => void		No

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "filter": "mini-antui/es/filter/index",
    "filter-item": "mini-antui/es/filter/filter-item/index"
  }
}
```

copy

```
<filter show="{{show}}" max="{{5}}" onChange="handleCallBack">
  <block a:for="{{items}}>
    <filter-item value="{{item.value}}" id="{{item.id}}" selected="{{item.selected}}"/>
  </block>
</filter>
```

copy

```
Page({
  data: {
    show: true,
    items: [
      { id: 1, value: 'Clothes', selected: true },
      { id: 1, value: 'Cupboard' },
      { id: 1, value: 'Hanger' },
      { id: 3, value: 'Digital' },
    ]
  }
})
```

```

        { id: 4, value: 'Door' },\
        { id: 5, value: 'Chair' },\
        { id: 7, value: 'Monitor' },\
        { id: 6, value: 'Game' },\
        { id: 8, value: 'Food' },\
    ]
},
handleCallBack(data) {
    my.alert({
        content: data
    });
},
toggleFilter() {
    this.setData({
        show: !this.data.show,
    });
}
);

```

Funnel management and analysis {#funnel-management-and-analysis}

Last updated: 2022-07-07

Path: miniprogram_gcash

Funnel management and analysis

2022-07-07 17:08

This topic introduces the funnel management and analysis functions that are provided by the Mini Program platform. To learn more about how to manage and analyze funnels, see [How to customize your analysis](#).

Funnel management

What are funnels?

A funnel consists of multiple events. Based on the funnel analysis, you can visualize the steps your users take to go through a task and quickly see the conversion rate between two steps. For example, how do general visitors become buyers? How do one-time buyers become repeat buyers? With this information, you can improve user journeys specifically.

Features

You can manage funnels in the following ways:

- View the funnel list

You can modify individual funnels under the funnel list page. All your funnels are displayed on the Funnel List page, and you can modify individual funnels by clicking **Edit or Delete**.

- Create a funnel

You can create a new funnel. A funnel must consist of at least two steps. Each step is defined by an event.

- Modify a funnel

You can modify a created funnel.

- Delete a funnel

You can delete a funnel.

Funnel analysis

Features

The funnel analysis function enables you to do the following:

- Set conditions for the funnel analysis

To set conditions for a funnel analysis, click on the **Manage Funnel** tab at the <page name> page.

- View the analysis result

You can view the analysis result in the form of table or graph.

Generate QR codes

2022-11-13 15:01

This topic provides steps to generate different promotion QR codes. A default QR code is available when a mini program is released. Depending on business requirements, you can also generate multiple QR codes based on this default QR code so that multiple users can quickly run your mini program by scanning these QR codes.

Procedures

1. Go to the **Manage Mini Programs** page and choose the mini program that you want to generate promotion QR codes. Then Click the **QR Code** tab and then **+Generate QR Code**.
2. Fill in the page URL, query parameter, and description of the mini program and click **Create**.

Now you have finished generating a promotion QR code.

Getting Started Guide {#getting-started-guide}

Path: miniprogram_gcash

Getting Started Guide

A quick-start guide for digital wallets and their merchants to learn the basic steps to get onboarded to the Mini Program Platform.

Get to know Mini Program

[Learn the basics about the latest technology and services of Mini Programs.](#)

[Watch this video to quickly learn how to manage Mini Programs on the platform.](#)

Onboarding to the Platform

[Apply an account and KYB for merchants or acquirers.](#)

Quickstart creating a mini program after onboarding on the Mini Program Platform for the first time.

Build your first Mini Program

Download Mini Program Studio and install the IDE.

Create a project and debug your demo Mini Program in the IDE.

Understand the file structure, global variables and page directory.

Preview the Mini Program on a device and upload the ready-to-go Mini Program to the Platform.

Release Mini Programs

Customize your Mini Programs according to cross-border or local businesses.

Start compatibility testing and go through an approval process to release the Mini Program.

Dive Deeper

Get the development resources and references such as components, framework, JS APIs and Open APIs.

Learn product features to use the Mini Program Console.

Dip into the rich UI guidelines to design a Mini Program.

Getting Started with Mini Program Platform {#getting-started-with-mini-program-platform}

Last updated: 2022-07-07

Path: miniprogram_gcash

Getting Started with Mini Program Platform

2022-07-07 17:08

The Mini Program Platform is a comprehensive solution to empower digital wallets to quickly start Mini Program businesses. It not only helps you to save the hardware deployment costs but also provides you with operation and maintenance support. You can also enjoy the regular service updates and new product features.

Procedures

Before you start, follow the integration steps below:

1. Contact us to create a Mini Program workspace for your app. You're required to provide the following:
 2. Your valid business license and point of contact
 3. Your APK signature, bundle ID, and package name
4. Once your Mini Program workspace creation is approved, you will receive a dedicated URL to access your Mini Program Developer Portal. You then make the following configuration settings:
 5. Replace the default URL to your business domain by configuring a reverse proxy server
 6. Customize the UI by replacing the default logo/favicon with your preferred logo
 7. Customize the email service
 8. Integrate the SDK
9. You will need to integrate the SDK (Android and iOS) in order to run the Mini Programs in your application.
10. Download the configuration from your Developer Portal and use it to initialize the SDK.
11. Implement the standard JS APIs. While the SDK provides the core Mini Program functionality, there are some features that are best presented with a customized implementation. For instance, when a Mini Program invokes the payment function, it is better to launch the existing payment flow instead of a completely new one.
12. Implement the standard backend APIs

You need to implement some standard backend APIs in order to support the Mini Program OAuth and Payment flow.

Now you can start using the Mini Program Platform.

Contact Us

If you're interested in using Mini Programs, please send us an email.

Git Management {#git-management}

Last updated: 2021-05-09

Path: miniprogram_gcash

Git Management

2021-05-09 18:43

Mini Program IDE supports use of visualized Git management tool to manage the project codes.

1. Initialize Git

When the project directory has no Git warehouse, you can directly initialize Git (`git init`).

2. Stage Change

You can choose to stage all changes by using one-key (`git add .`), or hover over individual file and choose to stage.

3. Submit Change

Submit the staged change locally (`git commit -m 'xxx'`)

Confirm the code diff and then do the submission operation.

4. Push to Remote Warehouse

Add to the warehouse (`git remote add origin xxxxxxx`)

Confirm and push (`git push origin`)

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev-old/mini-program-studio_function-panel_git-management

Global Configuration {#global-configuration}

Last updated: 2021-05-09

Path: miniprogram_gcash

Global Configuration

2021-05-09 18:43

`app.json` is used to implement global configuration and set up the path of page files, window display, multiple tabs and so on.

Here is a basic configuration example:

copy

```
{
  "pages": [
    "pages/index/index",
    "pages/logs/index"
  ],
  "window": {
    "defaultTitle": "Demo"
  }
}
```

Complete configuration item:

Attribute	Type	Required	Description
pages	Array	Yes	Set page path.
window	Object	No	Set default window display for all page.
tabBar	Object	No	Set the display of bottom tabbar.

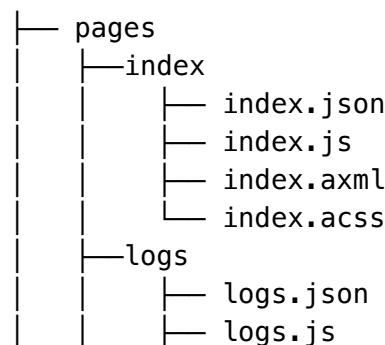

pages

In the `app.json`, the `pages` have the array attribute, with string for each member in the array, used to specify the pages of the Mini Program. In the Mini Program, adding or deleting pages modifies the `pages` array.

Each member of the `pages` array represents the path of the related page. The first member indicates the home of the Mini Program.

The page path does not need any suffix. The framework automatically loads the `.json`, `.js`, `.axml` and `.acss` files of the same name. For example, if the development directory is:

copy

```

|   |   └ logs.axml
|   app.json
|   app.js
└ app.acss

```

The following configuration shall be done in the `app.json`:

copy

```
{
  "pages": [
    "pages/index/index",
    "pages/logs/logs"
  ]
}
```

window

The window is used to set up the status bar, navigation bar, title, window background color, etc. for the Mini Program.

Sample codes:

copy

```
{
  "window": {
    "defaultTitle": "Default Title"
  }
}
```

	Property	Type	Required	Description	Minimum
version	defaultTitle String NO Default title of page. - pullRefresh String NO Allow pull-to-refresh or not, NO by default. Remarks: The precondition for pull-to-refresh to take effect is allowsBounceVertical YES. - allowsBounceVertical String NO Allow bounce vertical or not YES by default, supporting YES / NO. - transparentTitle String NO Navigation bar transparency setting none by default, supporting always (always transparent)/ auto (sliding adaptation)/ none (not transparent). - titlePenetrate String NO Allow navigation bar click-through or not No by default, supporting YES / NO. - showTitleLoading String NO Show navigation bar loading or not upon entrance No by default, supporting YES / NO. - titleImage String No Navigation bar picture address. - titleBarColor HexColor NO Background color of navigation bar, decimal color value (0-255). - backgroundColor HexColor NO Background color of page, decimal color value (0-255). - backgroundImageColor HexColor NO Background bottom color to display during pull-down, decimal color value (0-255). - backgroundImageUrl String NO URL of background to display during pull-down. - gestureBack String NO For iOS only, supporting gesture return or not No by default, supporting YES / NO. - enableScrollBar Boolean NO For Android only, showing Web View scroll bar or not YES by default, supporting YES / NO. - onReachBottomDistance Number NO Distance to page bottom for triggering bottom-out during pull-up, in px. Related documents Page event handler . Currently, the iOS does not support settings in the <code>page.json</code> , and only global settings are supported.				

tabBar

If the Mini Program is a multi-tab application (pages switchable in the window bottom bar of the client), the `tabBar` configuration item can be used to specify the tab presentation pattern and the corresponding page in case of tab switch.

Note:

- On the destination page via page jump (`my.navigateTo`) or page redirection (`my.redirectTo`), the bottom tab bar is not displayed even when the page is defined in the tabBar configuration.

The tabBar has the following configuration items:

Property	Type	Required	Description
<code>textColor</code>	HexColor	NO	Text color.
<code>selectedColor</code>	HexColor	NO	Highlighted text color.
<code>backgroundColor</code>	HexColor	NO	Background color.
<code>items</code>	Array	Yes	Each tab configuration.

Each item configuration:

Property	Type	Required	Description
<code>pagePath</code>	String	Yes	Set page path.
<code>name</code>	String	Yes	Name.
<code>icon</code>	String	NO	Common icon path.
<code>activeIcon</code>	String	NO	Highlighted icon path.

The recommended size of icon is 60x60 px. The pictures not in the recommended size will be stretched or scaled in unequal proportion.

Sample codes:

```
copy

{
  "tabBar": {
    "textColor": "#dddddd",
    "selectedColor": "#49a9ee",
    "backgroundColor": "#ffffff",
    "items": [
      {
        "pagePath": "pages/index/index",
        "name": "Home"
      },
      {
        "pagePath": "pages/logs/logs",
        "name": "Log"
      }
    ]
  }
}
```

Path: miniprogram_gcash

Global Configuration

2022-07-03 18:44

`app.json` is used to implement global configuration and set up the path of page files, window display, multiple tabs and so on.

Here is a basic configuration example:

copy

```
{
  "pages": [
    "pages/index/index",
    "pages/logs/index"
  ],
  "window": {
    "defaultTitle": "Demo"
  }
}
```

Complete configuration item:

Attribute	Type	Required	Description
pages	Array	Yes	Set page path.
window	Object	No	Set default window display for all page.
tabBar	Object	No	Set the display of bottom tabbar.

pages

In the `app.json`, the `pages` have the array attribute, with string for each member in the array, used to specify the pages of the Mini Program. In the Mini Program, adding or deleting pages modifies the `pages` array.

Each member of the `pages` array represents the path of the related page. The first member indicates the home of the Mini Program.

The page path does not need any suffix. The framework automatically loads the `.json`, `.js`, `.axml` and `.acss` files of the same name. For example, if the development directory is:

copy

```

  └── pages
      └── index

```

```

    |
    +-- index.json
    +-- index.js
    +-- index.axml
    +-- index.acss
    |
    +-- logs
        +-- logs.json
        +-- logs.js
        +-- logs.axml
    |
    +-- app.json
    +-- app.js
    +-- app.acss

```

The following configuration shall be done in the `app.json`:

copy

```
{
  "pages": [
    "pages/index/index",
    "pages/logs/logs"
  ]
}
```

window

The window is used to set up the status bar, navigation bar, title, window background color, etc. for the Mini Program.

Sample codes:

copy

```
{
  "window": {
    "defaultTitle": "Default Title"
  }
}
```

	Property	Type	Required	Description	Minimum
version	defaultTitle String NO Default title of page. - pullRefresh String NO Allow pull-to-refresh or not, NO by default. Remarks: The precondition for pull-to-refresh to take effect is allowsBounceVertical YES. - allowsBounceVertical String NO Allow bounce vertical or not YES by default, supporting YES / NO. - transparentTitle String NO Navigation bar transparency setting none by default, supporting always (always transparent)/ auto (sliding adaptation)/ none (not transparent). - titlePenetrate String NO Allow navigation bar click-through or not No by default, supporting YES / NO. - showTitleLoading String NO Show navigation bar loading or not upon entrance No by default, supporting YES / NO. - titleImage String No Navigation bar picture address. - titleBarColor HexColor NO Background color of navigation bar, decimal color value (0-255). - backgroundColor HexColor NO Background color of page, decimal color value (0-255). - backgroundImageColor HexColor NO Background bottom color to display during pull-down, decimal color value (0-255). -				

backgroundImageUrl | String | NO | URL of background to display during pull-down. | - |
 | gestureBack | String | NO | For iOS only, supporting gesture return or not No by default,
 supporting YES / NO. | - | enableScrollBar | Boolean | NO | For Android only, showing
 WebView scroll bar or not YES by default, supporting YES / NO. | - |
 onReachBottomDistance | Number | NO | Distance to page bottom for triggering bottom-
 out during pull-up, in px. Related documents [Page event handler](#). | Currently, the iOS
 does not support settings in the `page.json`, and only global settings are supported. |

tabBar

If the Mini Program is a multi-tab application (pages switchable in the window bottom bar of the client), the `tabBar` configuration item can be used to specify the tab presentation pattern and the corresponding page in case of tab switch.

Note:

- On the destination page via page jump ([my.navigateTo](#)) or page redirection ([my.redirectTo](#)), the bottom tab bar is not displayed even when the page is defined in the tabBar configuration.

The tabBar has the following configuration items:

||||| --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | | textColor | HexColor | NO | Text color. | | selectedColor | HexColor | NO | Highlighted text color. | | backgroundColor | HexColor | NO | Background color. | | items | Array | Yes | Each tab configuration. |

Each item configuration:

||||| --- | --- | --- | --- | --- | **Property** | **Type** | **Required** | **Description** | | pagePath | String | Yes | Set page path. | | name | String | Yes | Name. | | icon | String | NO | Common icon path. | | activeIcon | String | NO | Highlighted icon path. |

The recommended size of icon is 60×60 px. The pictures not in the recommended size will be stretched or scaled in unequal proportion.

Sample codes:

copy

```
{
  "tabBar": {
    "textColor": "#dddddd",
    "selectedColor": "#49a9ee",
    "backgroundColor": "#ffffff",
    "items": [
      {
        "pagePath": "pages/index/index",
        "name": "Home"
      },
      {
        "pagePath": "pages/logs/logs",
        "name": "Log"
      }
    ]
  }
}
```

```
  }\\"/>
]
}
}
```

A

ACL

An ACL (Access Control List) is a list of instructions that are applied to the router interface. These instruction lists are used to tell the router which packets can be received and which packets need to be rejected. Whether a packet is received or rejected can be determined by specific indications such as the source address, destination address, port number, and so on.

ACSS

ACSS is a style language that describes the style of AXML components and determines how AXML components should be displayed.

Android

Android is a free and open source operating system based on the Linux kernel which does not contain GNU components. The system is mainly used in mobile devices, such as smart phones and tablets. It is led and developed by Google Inc. and the Open Handset Alliance.

API

API (Application Programming Interface) is a set of rules and specifications that software programmes can follow to communicate with each other. An API serves as an interface between different software programs and facilitates their interaction.

App

An app, also known as mobile app is a software application that is designed to run on smartphones and other mobile devices.

App Container

App Container is a productive and secure runtime system to execute Mini Programs on mobile platforms of Android and iOS in any apps that are integrated with Mini Programs.

AXML

AXML is a set of tag languages designed by the Mini Program framework to describe the structure of Mini Program pages. The AXML syntax can be broken down into five parts: data binding, conditional rendering, list rendering, templates, and references.

app.json

App.json is a global configuration file of Mini Program, which is used to configure the general navigation bar title, window background color and other configurations of a Mini Program.

B

back-end running

The status when a Mini Program is not destroyed but still runs in the back end after a user closes the Mini Program or press the Home button to leave mobile App.

C

cold startup

A cold startup is the startup when a user opens a Mini Program that has not been started or has been destroyed.

cookies

Cookies are designed to be a reliable mechanism for websites to remember stateful information (such as items added in the shopping cart in an online store) or to record the user's browsing activity (including clicking particular buttons, logging in, or recording which pages were visited in the past).

CSS

CSS (Cascading Style Sheets) is a style sheet language to describe the presentation of a document written in a markup language such as HTML and XML. It can not only modify the web page statically, but also cooperate with a variety of scripting languages to dynamically format the elements of a web page.

CDN

CDN (Content Delivery Network or Content Distribution Network) is a geographically distributed network of proxy servers and their data centers, in order to provide high availability and performance by distributing the service spatially relative to end users.

D

DSL

DSL (Domain Specific Language) is a computer language specialized to a particular application domain. This is in contrast to a general-purpose language (GPL), which is broadly applicable across domains.

DOM

DOM (The Document Object Model) is a cross-platform and language-independent interface that treats an XML or HTML document as a tree structure wherein each node is an object representing a part of the document. The DOM represents a document with a logical tree.

E

ES

ES (ECMAScript) is a general-purpose programming language, standardized by Ecma International according to the document ECMA-262. It is a JavaScript standard meant to ensure the interoperability of Web pages across different Web browsers.

F

front-end running

The status when a Mini Program runs in the front end after a user opens the Mini Program for the first time.

H

hot startup

A hot startup is the startup when a user opens a Mini Program that has been opened but is running in back end.

HTML

An application of the Standard Generalized Markup Language that uses tags to mark elements, such as text and graphics, in a document to indicate how Web browsers should display these elements to the user and should respond to user actions.

I

IDE

IDE (Integrated Development Environment) is a software application that provides comprehensive facilities to computer programmers for software development. An IDE normally consists of at least a source code editor, build automation tools and a debugger. The IDE for Mini Program development is called Mini Program Studio.

iOS

iOS (formerly iPhone OS) is a mobile operating system that is created and developed by Apple Inc. exclusively for its hardware.

ISV

ISV (Independent Software Vendor) is an individual or organization that develops, markets, and sells software solutions that run on one or more computer hardware providers like Macintosh, operating systems like iOS, or cloud platforms like Amazon Web Services. In a Mini Program, ISV usually act as the third-party service developer to develop and operate the Mini Program on behalf of merchants.

icon

A pictogram used on the user interface to assist with navigation.

J

JS

JS (Java Scripting) is a scripting language that is used by Web page authors in designing interactive sites. It can interact with HTML source code, enabling Web developers to enhance their websites with dynamic content.

JSON

JSON (JavaScript Object Notation) is a lightweight data-interchange format. It is easy for humans to read and write. It is easy for machines to parse and generate.

JSAPI

JSAPI is the client-side (front-end) API of Mini Programs. It can be divided into 14 categories according to the functions that can be realized, including interface, multimedia, cache, file, location, network, equipment, data security, sharing, collection, custom general menu, the type of small program currently running version, custom analysis, and update management.

L

lifecycle

Lifecycle is the life and death of an object. It usually refers to the process by which a program is created, started, paused, evoked, stopped, and uninstalled. The lifecycle of a Mini Program can be divided into application lifecycle and page lifecycle.

M

mini program

Mini Programs are sub-applications that run inside a mobile app.

mini program component

Mini program components are mini program view controls which allow developers to combine components for development.

mini program framework

The Mini Program is divided into two layers: app and page. The app describes the whole program; the page describes the individual pages.

Mini program Developer Portal

Mini program developer portal is a website where external developers can get tools, resources, and documentation for mini program development. To get started, the 3rd-party developer needs to register a developer account and submit necessary KYC document for verification purpose.

Mini Program Studio

Mini Program Studio is the Integrated Development Environment (IDE) for developers to write code for Mini Programs. It has a built-in Simulator for Preview, and a debug console to monitor the logs, as well as a full-fledged code editor that provides syntax lighting and auto-completion.

Mini Program Platform

Mini Program Platform is a platform that supports full mini program development lifecycle and runtime operations.

N

NPM

NPM is the default package manager for the JavaScript runtime environment Node.js. It consists of a command line client (also called NPM) and an online database of public and paid-for private packages (called the NPM registry).

O

Open API

Open API is the server-side (back-end) API of Mini Programs. With open APIs, Mini Programs can realize a number of functions such as user authorization, acquisition of member's basic information, and acquisition of user's phone number.

P

page lifecycle

Page lifecycle refers to the process of a page from entry to departure or from one page to another in a mini program.

PV

A PV (page view) is a Web analytics term that refers to each time when a Web page is successfully loaded onto a user's Web browser.

Q

QR code

Quick Response code that is used to provide access to information or mini programs on a smartphone.

R

RPX

Responsive Pixel that can be adapted with screen widths.

S

silence mode

Silence mode is used to get sensitive user information, which requires the user's permission on a wallet app.

SJS

SJS (Safe/Subset Javascript) is a set of custom scripting language of Mini Program that is used to build page structure in AXML.

SMTP

SMTP (Simple Mail Transfer Protocol) is a communication protocol for electronic mail transmission.

SSL

SSL (Secure Sockets Layer) is a standard security technology to establish an encrypted link between a server and a client.

U

user consent mode

User consent mode is the mode to get public user information without further permission from wallets.

UI

UI (User Interface) refers to the overall design of man-machine interaction, manipulation logic and Interface of software.

URI

URI (Uniform Resource Identifiers) is a unique identifier used by web technologies. URIs may be used to identify anything, including real-world objects, such as people and places, concepts, or information resources such as web pages and books.

UTC

UTC (Coordinated Universal Time) is the primary time standard by which the world regulates clocks and time. It is within about 1 second of mean solar time at 0° longitude, and is not adjusted for daylight saving time.

URL

A URL (Uniform Resource Locator), colloquially termed a web address, is a reference to a web resource that specifies its location on a computer network and a mechanism for retrieving it. A URL is a specific type of Uniform Resource Identifier (URI), although many people use the two terms interchangeably.

UV

UV (Unique Visitor) is a person who visits a site at least once in a reporting period as determined by their IP address.

W

webview

A view that displays web content inside the application. The mini program provides a web-view component to implement this function.

Grid {#grid}

Last updated: 2022-07-03

Path: miniprogram_gcash

Grid

2022-07-03 18:44

Grid.

Property	Description	Type	Default	Required	list
Grid data.	Array<icon, text> []	Yes	onGridItemClick	Callback when the grid is clicked.	
(index: Number) => void	No	columnNum	Number of columns displayed per row	2, 3, 4, 5	3
No	circular	Circular or not, take effect when the columnName value is 4.	Circular	Boolean	false
No	hasLine	Have borderline or not.	Boolean	true	No

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "grid": "mini-antui/es/grid/index"
  }
}
```

copy

```
<grid onGridItemClick="onItemClick" columnNum="{{3}}" list="{{list3}}"
/>
```

copy

```
Page({
  data: {
    list3: [
      {
        icon: 'https://img.example.com/example1.png',
        text: 'Title',
        desc: 'text',
      },
      {
        icon: 'https://img.example.com/example2.png',
        text: 'Title',
        desc: 'text',
      },
      {
        icon: 'https://img.example.com/example3.png',
        text: 'Title',
      }
    ]
  }
})
```

```
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example4.png',\
        text: 'Title',\
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example5.png',\
        text: 'Title',\
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example6.png',\
        text: 'Title',\
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example7.png',\
        text: 'Title',\
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example8.png',\
        text: 'Title',\
        desc: 'text',\
    },\
    {\
        icon: 'https://img.example.com/example9.png',\
        text: 'Title',\
        desc: 'text',\
    },\
],\
},\
onItemClick(ev) {
    my.alert({
        content: ev.detail.index,
    });
},\
});
```

How to add members to workspaces {#how-to-add-members-to-workspaces}

Last updated: 2022-07-08

Path: miniprogram_gcash

How to add members to workspaces

2022-07-08 02:08

Overview

This topic provides steps for the wallet and merchants to add members to their own workspaces. After onboarding on Mini Program Platform, the wallet and merchants can add members to collaborate to manage their workspaces.

For members who have permission to add members to workspaces, see the following figure:

- Wallet: Only workspace admins have permission to add members to their workspaces.
- Merchant: Only developer admins have permission to add members to their workspaces.

Procedures

To add members to a workspace, you can follow the steps below:

Step 1: Navigate to Members tab

Log in to the platform and click **Members** on the navigation panel to the left. Then, click **+ New Members** to initiate the process.

Step 2: Invite members

Fill in the member's name and email and then set the role for the member. Roles on the platform are different for the wallet and merchants, see [Workspace member roles](#) for more information.

For the wallet

- You can set the member as a workspace admin, workspace reviewer, workspace developer, or workspace operator. If set the member as a workspace developer, you need to assign mini programs for the role.

For merchants

You can set the member as a developer admin, developer, or operator. If set the member as a developer or operator, you need to assign mini programs for the role.

After setting the role for the member, click **Invite** to send an invitation email to the member.

Step 3: Manage invitation

A member invitation is valid for 3 days since you send it to the member. During this period, you can withdraw the invitation before the member accepts it. Once withdrawn, you need to initiate the process again to add the member to the platform. If the invitation is expired, you can resend the invitation to the member.

Step 4: Manage members

After the member joins the workspace, you can block, delete, and set roles for the member. In addition, you can also check the statuses of members.

Block members

To block a member, click **Block** to continue the process. The blocked member cannot perform operations based on the assigned role but the member still displays on the member list. Once blocked, the member status will change from **Active** to **Inactive**.

Delete members

To delete a member, click **Delete** to continue the process. Once deleted, the member will be removed from the workspace. You can invite the member again.

Set roles for members

To set roles for a member, click **Set Role** and select the role that you want to set for the member. Then confirm the action to change member's role to the new one.

Check member status

Members who are invited to join a workspace move through different statuses from the time they are invited to when they are blocked.

		Status	Description	Possible Actions	Invitation Sent	Indicates that a workspace admin or developer admin has sent the invitation to a member and waits for the member to join the workspace.	Withdraw the invitation.	Invitation Expired	Indicates that a workspace admin or developer admin has sent the invitation to a member but the member didn't accept it within the valid period.	Resend or withdraw the invitation.	Active	Indicates that a member accepted the invitation to join the workspace. The member can perform operations normally based on the assigned role.	Block, delete, or set roles for the member.	Inaction	Indicates that a member accepted the invitation to join a workspace but was blocked later. The member cannot perform operations normally until he or she is unblocked.	Unblock or set roles for the member.	
1	1	---	---	---	1	1	1	1	1	1	1	1	1	1	1	1	1

How to apply for authorization {#how-to-apply-for-authorization}

Last updated: 2022-07-07

Path: miniprogram_gcash

How to apply for authorization

2022-07-07 17:08

This procedure is available for ISV. When the ISV registers as a Third-Party Developer, the ISV can apply for the authorization.

Procedure

To apply for the authorization, complete the following steps:

1. Apply for an account.
2. Log into your account and go to the **Authorization** page.
3. Provide the following information to apply for the authorization:

- You company name
- Merchant name
- Merchant email
- Client ID
- Reason

Your approval request is now submitted. You will be automatically authorized after your request is approved by workspace admins.

How to customize your analysis {#how-to-customize-your-analysis}

Last updated: 2022-07-07

Path: miniprogram_gcash

How to customize your analysis

2022-07-07 17:08

This document is intended for mini program developers to customize their analysis and track user behavior in a mini program.

What is customized analysis?

With the customized analysis function, you can perform multi-dimensional and near real-time analysis of user behavior in a mini program. In addition to the standard analysis, such as page views (PV) and unique visitors (UV), you can define different conditions and metrics to measure the mini program's performance according to user behavior.

For example, for an e-commerce mini program, you can configure the settings and obtain detailed analysis on the following scenarios:

1. What is the conversion rate for users who have taken a certain path, from viewing the product page, product details, user reviews, to placing an order, and finally paying to complete the purchase?
2. What is the participation rate of online activities across different hourly time periods?

Prerequisites

To get the most of your customized analysis, you need to have basic statistics to measure the analysis against. For example, you can analyze an e-commerce mini program from the following aspects:

- Order quantity and total payment.
- The conversion rate and churn rate at each step in the purchase process.

Procedures

To customize your analysis to meet your business requirements, complete the following steps:

1. Define an event

Define an event and configure the data reporting method based on your requirements. An event is an action made by the user in the mini program.

2. Publish an event

Collect data after publishing an event.

3. Analyze events and funnels

Analyze data collected according to events.

Related information

You can read more details about the analysis features in the following topics:

- Event management and analysis
- Funnel management and analysis

How to release mini programs {#how-to-release-mini-programs}

Last updated: 2022-07-07

Path: miniprogram_gcash

How to release mini programs

2022-07-07 17:08

This topic introduces how to release mini programs in a workspace and what are preparations you need to make before starting the release process.

Before you begin

Before you release mini programs, you need to get ready with some prerequisites and check how members join the creation and release process:

- [Apply for an account](#)
- Complete the on-boarding process:
 - For wallets: [create the tenant workspace](#)
 - For merchants: [onboard to the tenant workspace](#)
- [Download Mini Program Studio \(IDE\)](#)
- Check how [mini program member roles](#) collaborate to construct the mini program life cycle.

Procedures

For a guided tour on how to release mini programs, see the following steps:

1. [Create mini programs](#)
2. [Add mini program members](#)
3. [Upload versions](#)
4. [Configure mini programs](#)
5. [Release versions](#)
6. [Generate QR codes](#)
7. [Delete mini programs](#)

How to send your feedback {#how-to-send-your-feedback}

Last updated: 2022-07-07

Path: miniprogram_gcash

How to send your feedback

2022-07-07 17:08

If you have any questions or suggestions on the mini program platform, you can send us your feedback in the header toolbar.

Procedures

1. Open your workspace
2. Select Feedback in the header toolbar and you can see Feedback to the Console.
3. Enter the following details:
 - Feedback Title
 - Feedback Type
 - Description
 - Attachment
4. Choose Submit, and your feedback is now sent to us.

How to transform an HTML 5 mobile app into an HTML 5 mini program {#how-to-transform-an-html-5-mobile-app-into-an-html-5-mini-program}

Last updated: 2022-07-07

Path: miniprogram_gcash

How to transform an HTML 5 mobile app into an HTML 5 mini program

2022-07-07 17:08

This topic describes the process to transform an HTML5 mobile app (native app) into an HTML5 mini program. With the web development approach, Progressive Web Application (PWA), this transformation makes it possible to have a scalable solution while keeping the digital experience consistent.

The following two types of mini programs are supported on Mini Program Platform:

- **Mini Program based on DSL (Domain Specific Language)**

We recommend that you develop the default DSL-based mini programs. For more information, see [About Mini Program](#).

- **Mini Program based on HTML5**

However, to help you integrate your existing HTML5 mobile apps with the wallet app, you can choose the HTML5 mini program type.

What are HTML5 mini programs?

HTML5 mini programs are the mini programs that are transformed from HTML5 mobile apps. HTML5 mini programs run in the WebView environment, so you can develop HTML5 mini programs as you do for web pages. Compared with HTML5 mobile apps, HTML5 mini programs are powered with more capabilities by calling mini program JS APIs, thus improving user experience.

Benefits

There is no need to start from scratch if you already have an existing HTML5 mobile app. Different roles can enjoy the following benefits by transforming your HTML5 app into a mini program:

- **Convenient**

As compared with the time-consuming learning of the Mini Program framework, developers can reuse their familiar web development knowledge to get started with Mini Program.

- **Cost-efficient**

Merchants, ISVs, and wallet developers just need to add a few lines of JavaScript code to the existing HTML5 app, and the HTML5 mini programs become ready.

- **Consistent and user-friendly**

End users can also benefit from a consistent user experience of mini programs and native apps.

Before you start

Before you start, make sure you have applied for an account and get on-boarded.

Also, you can see the following process flow to get an overview of the detailed steps:

Note:

As compared with the steps of DSL mini programs, the following steps that are shown in red in the above process flow are required:

- **HTML5 mini program type**
- **Entrance URL**

Entrance of the HTML5 mini program. You can modify the entrance URL after the HTML5 mini program is created.

The following steps that are shown in gray in the above process flow are optional:

- **IDE**

You can develop the HTML5 mini programs just like you develop HTML5 web pages.

- **Build package process**
- **Quality review**

See [procedures](#) for a step-by-step guide on how to transform an HTML5 mobile app (native app) into an HTML5 mini program.

Procedures

To transform HTML5 apps to mini programs, complete the following steps:

Step 1: Create the HTML 5 mini program

When you create a new mini program, choose **Mini Program Based on HTML5** and enter the URL of your HTML5 mobile app into the **Entrance URL** field.

For more information on creating mini programs, see [Create Mini Programs](#).

Step 2: Use wallet capabilities

To use the mini program JSAPIs, integrate the SDK according to your business requirements.

a. Mini Program JSAPIs in HTML5

Follow the steps below to use mini program JSAPIs in HTML5:

1. Import the JSBridge SDK by importing the following JS file to the HTML file:

copy

```
<script src="https://cdn.marmot-cloud.com/npm/hylid-
bridge/1.0.5/index.js"></script>
```

See the following HTML sample codes for reference:

copy

```
<!DOCTYPE html>
<html>
<head>
    <title>Miniprogram JSAPI Demo</title>
    <script src="https://cdn.marmot-cloud.com/npm/hylid-
bridge/1.0.5/index.js"></script>
</head>
<body>
    <div>
        <button id="alert">my.alert</button>
    </div>
    <script>
        var alertButton = document.getElementById('alert');
        alertButton.addEventListener('click', function () {
            my.alert({
                title: 'Test Alert!!!',
                content: window.navigator.userAgent,
                buttonText: 'Alert Button',
            });
        });
    </script>
</body>
</html>
```

```

success: function (res) {
    my.alert({
        content: 'success!' + JSON.stringify(res),
    });
},
fail: function () {
    my.alert({
        content: 'fail!',
    });
},
complete: function () {
    my.alert({
        content: 'complete!',
    });
},
});
</script>
</body>
</html>

```

2. Call an API from the following available API list. The parameter in the API is an object. Each API has the following properties:

- **success**: callback function that indicates the successful API calling.
- **fail**: callback function that indicates the failed API calling.
- **complete**: callback function that indicates the completed API calling.

Take the **my.alert** JSAPI as an example. In this API, **success**, **fail**, and **complete** are the common properties. Specific properties are **title**, **content**, and **buttonText**.

For example, see the following sample codes to know how the **IAlertOptions** interface can be defined:

copy

```

interface IAlertOptions {
    title?: string;
    content?: string;
    buttonText?: string;
    success?: () => void;
    fail?: () => void;
    complete?: () => void;
}

```

Available API list

The following table lists all available JSAPIs. You can apply for your own JSAPIs if required.

||||---|---|| **JSAPI Name | Description** || my.alert | Displays alert box. || my.confirm | Displays confirmation box. || my.prompt | Prompts a user input || my.showToast | Displays a toast, which disappears within certain seconds. || my.hideToast | Hides a toast. || my.showLoading | Displays the loading message. || my.hideLoading | Hides the loading message. || my.setNavigationBar | Sets the navigation bar text and style. || my.showNavigationBarLoading | Shows navigation bar loading. || my.hideNavigationBarLoading | Hides navigation bar loading. || my.request | Network request || my.getSystemInfo | Gets system information. || my.getNetworkType | Gets current network status. || my.showAuthGuide | Guides users to grant the authorization when the permission is needed. || my.getAuthCode | Gets user's authorization code. || my.saveImage | Saves online images to cellphone album. || my.chooseImage | Takes a photo or chooses a photo from the album on the phone. || my.previewImage | Previews images. || my.getImageInfo | Gets image information. || my.hideKeyboard | Hides keyboard. || my.setStorage | Stores the data in the specified key in the local cache, which overlaps with the original data corresponding to the key. || my.getExternalStorage | Gets cached data. || my.removeStorage | Removes cached data. || my.clearStorage | Clears local data cache. || my.tradePay | Initiates a payment. || my.navigateToMiniProgram | Jumps to other mini programs. || my.navigateBackMiniProgram | Returns to the previous Mini Program, only when another Mini Program jumps to the current Mini Program. || my.getClipboard | Gets the clipboard data. || my.setClipboard | Sets the clipboard data. || my.vibrate | Invokes the vibrate ability of the device. || my.makePhoneCall | Makes a phone call. || my.multiLevelSelect | Selects in multiple levels. || my.choosePhoneContact | Chooses the phone number of a contact person || my.getLocation | Gets the current geographical location of the user. |

b. Open APIs

Depending on the wallet capabilities, you can use different open APIs.

Step 3: Release the mini program

You can request to release the mini program after the development. Before you submit the release request for approval, you need to check if all the required information is filled in. Enter the required information under **Mini Programs > Info** if you find some required information is missing. For more information, see [Release Mini Programs and Approvals](#).

Now you have completed the process of transforming the HTML app into a mini program. You can start to manage the mini program on the platform. For more information, see [Manage Mini Program](#).

Precautions

Browser compatibility

When the page is running in a browser, mini program JSAPIs cannot be called. You need to identify whether the page is running in a mini program or a browser by UserAgent, and then take actions accordingly.

See the following sample codes for reference:

copy

```
if (/MiniProgram/.test(navigator.userAgent)) {  
    my.tradePay(params)  
} else {  
    // process payment in other browsers.  
}
```

UserAgent

UserAgent which is retrieved via navigator.userAgent has some specific fields like **MiniProgram**, which can be used to identify whether the web page runs as an HTML mini program.

For a whole UserAgent, see the following sample codes for reference:

copy

```
Mozilla/5.0 (iPhone; CPU iPhone OS 14_4 like Mac OS X)  
AppleWebKit/605.1.15 (KHTML, like Gecko) Mobile/18D46 ChannelId(35)  
Ariver/1.0.11 Griver/2.23.0 AppContainer/1.9.1 MiniProgram
```

Restrictions

Reserved objects

my.JSBridge is reserved for global objects defined in the PWA runtime, and you cannot modify them.

console.log

The PWA runtime strongly depends on the default console.log object in the web context, which cannot be overridden or modified.

How-to videos

2022-07-07 17:08

The Mini Program Platform provides comprehensive functionalities for you to develop and manage mini programs. To have a quick start for the mini program platform, you can watch the video tutorials.

Manage mini programs

For a quick overview of how to manage mini programs, you can watch a video here:

For more information about the introduction to the Mini Program Manage functionality, see [Manage Mini programs](#).

Customize your analysis

For a quick overview of how to customize your analysis on mini programs, you can watch a video here:

For more information about the Customized Analysis functionality, see [Event management and analysis](#) and [How to customize your analysis](#).

IDE Debugging

2022-07-03 18:44

Overview

We provide two debugging methods:

- Simulator + Debugging tool
- Remote real machine debugging

The simulator can simulate most of the real machine APIs and has an integrated debugging tool. We suggest completing basic function and style debugging in the simulator and then performing the verification and debugging on real machine. However, the final running result shall be based on the real machine.

Simulator

The simulator provides the following functions:

- Device simulation (dimension, precision, etc.)
- Compiling log, compiling error prompt, refresh
- JSAPI simulation, custom configuration of simulation interface including position, Bluetooth, startup parameter, etc.

Debugging Tool

Together with the simulator, we provide customized Chrome devtool, and provide extension, such as axml, on basis of that. Default extensions include:

- AXML: Mini Program element based dom, css debugging
- Console: operation log, error viewing
- Storage: buffer data viewing and editing
- Sources: source code viewing and breakpoint debugging
- Network: network resource and requests viewing

Remote Debugging

In the remote debugging mode, a connection is established between IDE and cellphone. At the IDE end, you may perform breakpoint check, runtime information check, Network/Storage information viewing, remote log viewing, and so on. See more details in **Remote Debugging** document.

Idempotency

2021-05-09 18:43

If a request timeout error occurs when you call an API, you might attempt to resend the request. In this case, you can configure the specified idempotency fields in the request to help avoid unwanted duplication in case of failures and retries.

An API call is idempotent if it has the same result no matter how many times the API call is applied. For example, idempotency can guarantee that the payment is charged only once if the same API payment call is retried multiple times in the case of a timeout error. You can retry the request via using the same idempotency field to guarantee that no more than one charge is created.

Idempotency fields

The following table lists the idempotency fields of specific OpenAPI.

Interface name	Idempotency field	Rule
- /v1/payments/pay - /v2/payments/pay	paymentRequestId	This field is used for the idempotence control. For the payment requests which are initiated with the same paymentRequestId and reach a final status (S or F), the must return the unique result.
- /v1/payments/refund - /v2/payments/refund	refundRequestId	This field is used for the idempotence control. For the refund requests which are initiated with the same refundRequestId and reach a final status (S or F), themust return the unique result.

InputItem

2022-07-03 18:44

Text input.

Sample Code

copy

```
// API-DEMO page/component/input-item/input-item.json
{
  "defaultTitle": "Mini Program AntUI component library",
  "usingComponents": {
    "list": "mini-antui/es/list/index",
    "list-item": "mini-antui/es/list/list-item/index",
    "input-item": "mini-antui/es/input-item/index",
    "picker-item": "mini-antui/es/picker-item/index"
  }
}
```

copy

```
<!-- API-DEMO page/component/input-item/input-item.axml -->
<view>
  <view style="margin-top: 10px;" />
  <list>
    <input-item
      data-field="cardNo"
      clear="{{true}}"
      value="{{cardNo}}"
      className="dadada"
      placeholder="Bank card number"
      focus="{{inputFocus}}"
      onInput="onItemInput"
      onFocus="onItemFocus"
      onBlur="onItemBlur"
      onConfirm="onItemConfirm"
      onClear="onClear"
    >
      Card number
      <view slot="extra" class="extra" onTap="onExtraTap"></view>
    </input-item>
    <picker-item
      data-field="bank"
      placeholder="Select issuing bank"
      value="{{bank}}"
      onPickerTap="onPickerTap"
    >
      Issuing bank
    </picker-item>
  </list>
</view>
```

```
</picker-item>
<input-item
  data-field="name"
  placeholder="Name"

  opacity: 0.2;
  height: 20px;
  width: 20px;
  padding-left: 10px;
}

```

Attributes

Property	Description	Type	Default	className
Customized class.	String	"	labelCls	Customized label class.
Customized input class.	String	"	last	Is the last row or not.
Initial contents.	String	"	name	Component name, used for getting data via form submission.
		"		value
		"		type
		"		Type of input, effective values including text, number,

idcard and digit (see table below for details). | String | text || password | Is password type or not. | Boolean | false || placeholder | Placeholder. | String | " || placeholderStyle | Specify the style of the placeholder. | String | " || placeholderClass | Specify the style class of the placeholder. | String | " || disabled | Disable or not. | Boolean | false || maxlength | Maximum length. | Number | 140 || focus | Get focus. | Boolean | false || clear | Have clear function or not, taking effect only when disabled is false. | Boolean | false || onInput | Trigger the input event on keyboard input. | (e: Object) => void | - || onConfirm | Trigger on clicking keyboard completion. | (e: Object) => void | - || onFocus | Trigger on getting focus. | (e: Object) => void | - || onBlur | Trigger on losing focus. | (e: Object) => void | - || onClear | Trigger on clicking the clear icon. | () => void | - |

Description of type attribute value

- text: Character input box
- number: Pure number input box (number within 0-9)
- idcard: Input box for ID card number (number within 0-9 and character x)
- digit: number input box (number within 0-9 and decimal point . used for number containing a decimal)

Note: The type attribute value affects the keyboard type with real machine and may not be effective in simulators.

Slots

||||| --- | --- | --- || slotname | Description | Required || extra | Used to render the description right to input-item. | No |

Common Questions

When the `setData` data is empty, the breakpoint money value is set to empty, but why 0 is still shown in the input box?

When `this.setData` sets data as empty, it does not render the page. It is recommended to use the component clear.

Introduction

2021-05-09 18:43

By calling `my.canIUse('component')`, it is possible to judge whether the custom component function is usable in the current version. For the usage of `my.canIUse()`, see [canIUse](#).

The custom component function can abstract the functions to be reused into custom component so that it can be reused on different pages. It also allows publishing custom component on npm, so that it can be reused in different Mini Programs. For the usage of npm, see [npm](#).

The `my.canIUse('component2')` can be used to check if the current version supports the new custom component function.

To use the related functions of component2, in the **Details > Project configuration** of the developer tool, check component2:

JSAPI {#jsapi}

Last updated: 2022-07-07

Path: miniprogram_gcash

JSAPI

2022-07-07 17:08

You can create JSAPIs as the metadata that can be used to construct the content of a feature. You can select multiple JSAPIs for a feature and assign this feature to a mini program. For more information, see [Feature](#).

Features

You can perform the following activities:

- Create new JSAPIs with the following details:
 - JSAPI Name (Mandatory)
 - JSAPI Usage Scenarios (Mandatory)
- App: You can choose the native app to which the mini program with this JSAPI is released.
- Request and response parameters (callback and return parameters)
- Error Code
- Sample Code

Note:

You can refer to the JSAPI details in your IDE and enter the details to these above accordingly. For more information, see [JSAPI Reference](#).

- See JSAPIs in a list

You can see the name, description, status, and change history of the JSAPIs in a list.

JSAPI Reference {#jsapi-reference}

Last updated: 2023-01-29

Path: miniprogram_gcash

JSAPI Reference

2023-01-29 20:55

Basic

||||---|---|| **API Name** | **Function Description** || my.canIUse | Judge whether the current Mini Program API, incoming parameter or return value, component, attribute, etc. are supported in the current version. || my.SDKVersion | Get the SDK version. || my.getAppIdSync | Obtain the Mini Program App ID synchronously. || my.getRunScene | Obtain the running version of the current Mini Program. |

In-App Event

||||---|---|| **API Name** | **Function Description** || my.offAppHide | Unlisten for the event that the mini program is switched to background from foreground. || my.offAppShow | Unlisten for the event that the mini program is switched to foreground from background. || my.onAppHide | Listen for the event that the mini program is switched to background from foreground. || my.onAppShow | Listen for the event that the mini program is switched to foreground from background. || my.offError | Unlisten for the event that JS errors occur in the mini program. || my.onError | Listen for the event that errors occur in the mini program. || my.offUnhandledRejection | Unlisten for the *unhandledrejection* event. || my.onUnhandledRejection | Listen for the *unhandledrejection* event. |

UI

NavigationBar

||||---|---|| **API Name | Function Description** || my.hideBackHome | Hide back to home button. || my.showNavigationBarLoading | Show navigation bar loading. || my.hideNavigationBarLoading | Hide navigation bar loading. || my.setNavigationBarText | Set the navigation bar text and style. |

TabBar

||||---|---|| **API Name | Function Description** || my.hideTabBar | Hide the tabBar. || my.setTabBarStyle | Set the style of tabBar. |

Note: For the FAQs of tab bar, refer to TabBar FAQ.

Route

||||---|---|| **API Name | Function Description** || my.switchTab | Jump to the specified tabBar page and close all other pages that are not tabBar. || my.navigateTo | Maintain the current page and jump to the specified page within the application. Use my.navigateBack to return to the original page. || my.navigateBack | Close the current page and return to the previous one or more pages. || my.redirectTo | Close the current page and jump to the specified page within the application. || my.reLaunch | Close all current pages and jump to the specified page within the application. |

FeedBack

||||---|---|| **API Name | Function Description** || my.alert | Alert box. || my.confirm | Confirm box. || my.prompt | Prompt box. || my.showLoading | Show the loading hint. || my.hideLoading | Hide the loading hint. || my.showToast | Show a weak hint, which disappears in the specified seconds. || my.hideToast | Hide the weak hint. || my.showActionSheet | Display an operation menu. |

Pulldown

||||---|---|| **API Name | Function Description** || my.startPullDownRefresh | Start the pull-to-refresh function. || onPullDownRefresh | On the Page, customize the onPullDownRefresh function to listen to the pull-to-refresh event of user. || my.stopPullDownRefresh | Stop the pull-to-refresh for the current page. |

Contact

||||---|---|| **API Name | Function Description** || my.choosePhoneContact | Choose contact from system contact. |

Choose Data

||||---|---|| **API Name** | **Function Description** || my.datePicker | Open a date selection list. |

Animation

||||---|---|| **API Name** | **Function Description** || my.createAnimation | Create an instance of animation. |

Canvas

||||---|---|| **API Name** | **Function Description** || my.createCanvasContext | Create the context of the canvas. |

Keyboard

||||---|---|| **API Name** | **Function Description** || my.hideKeyboard | Hide keyboard. |

Scroll

||||---|---|| **API Name** | **Function Description** || my.pageScrollTo | Scroll to the destination location of the page. |

SelectorQuery

||||---|---|| **API Name** | **Function Description** || my.createQuery | Create an instance of SelectorQuery. |

Multiple Level Select

||||---|---|| **API Name** | **Function Description** || my.multiLevelSelect | Multiple level selector, used for associated select with multiple levels. |

Set Background

||||---|---|| **API Name** | **Function Description** || my.setBackgroundColor | Set background color. |

Set Page Pulldown

||||---|---|| **API Name** | **Function Description** || my.setCanPullDown | Set whether page can support pulldown. |

Media

Image

||||---|---|| **API Name | Function Description** || my.chooseImage | Choose image from camera or album of cellphone. || my.previewImage | Preview image. || my.saveImage | Save the online images to cellphone album. || my.getImageInfo | Get the information of the image. || my.compressImage | Compress large images to fulfill the size restrictions from some mini programs. |

Storage

||||---|---|| **API Name | Function Description** || my.getStorage | Get cached data. || my.getStorageSync | Get cached data synchronously. || my.setStorage | Store the data in the specified key in the local cache, which overlaps the original data corresponding to the key. || my.setStorageSync | Store synchronously the data in the specified key in the local cache. || my.removeStorage | Remove cached data. || my.removeStorageSync | Remove cached data synchronously. || my.clearStorage | Clear local data cache. || my.clearStorageSync | Clear local data cache synchronously. |

File

||||---|---|| **API Name | Function Description** || my.sendFile | Save file to the device. || my.getFileInfo | Get the information of the file. || my.getSavedFileInfo | Get the information of the saved file. || my.getSavedFileList | Get the information of all the saved file. || my.removeSavedFile | Remove the saved file. || my.chooseFileFromDisk | Choose a file to upload. || my.openDocument | Enable users to preview a PDF file within the mini program. |

Location

||||---|---|| **API Name | Function Description** || my.getLocation | Get the current geographical location of the user. || my.openLocation | View the location on the built-in map. || my.chooseLocation | Open the built-in map to choose a location. |

Map

||||---|---|| **API Name | Function Description** || my.createMapContext | Create and return a map context object mapContext. |

Network

||||---|---|| **API Name | Function Description** || my.request | Network request. || my.uploadFile | Upload the local resource to the developer server. || my.downloadFile | Download file resource to local location. || my.connectSocket | Create a WebSocket

connection. || my.onSocketOpen | Listen to the event of enabling the WebSocket connection. || my.offSocketOpen | Unlisten to the event of enabling the WebSocket connection. || my.onSocketError | Listen to WebSocket error events. || my.offSocketError | Unlisten to WebSocket error events. || my.sendSocketMessage | Send data over WebSocket connection. || my.onSocketMessage | Listen to the event of receiving server messages by WebSocket. || my.offSocketMessage | Unlisten to the event of receiving server messages by WebSocket. || my.closeSocket | Close the WebSocket connection. || my.onSocketClose | Listen to the event of closing the WebSocket connection. || my.offSocketClose | Unlisten to the event of closing the WebSocket connection. |

Device

System Information

||||---|---|| **API Name** | **Function Description** || my.getSystemInfo | Get system information. |

Network Status

||||---|---|| **API Name** | **Function Description** || my.getNetworkType | Get the current network status. |

Clipboard

||||---|---|| **API Name** | **Function Description** || my.getClipboard | Get the clipboard data. || my.setClipboard | Set the clipboard data. |

Watch Shake

||||---|---|| **API Name** | **Function Description** || my.watchShake | The watchshake function. |

Accelerometer

||||---|---|| **API Name** | **Function Description** || my.onAccelerometerChange | Listen to the acceleration data event. || my.offAccelerometerChange | Unlisten to the acceleration data event. |

Compass

||||---|---|| **API Name** | **Function Description** || my.onCompassChange | Listen to the compass data change event. || my.offCompassChange | Unlisten to the compass data change event. |

Vibrate

||||---|---|| **API Name** | **Function Description** || my.vibrate | Invoke the vibrate ability of device. |

Make Phone Call

||||---|---|| **API Name** | **Function Description** || my.makePhoneCall | Make a phone call. |

Get Server Time

||||---|---|| **API Name** | **Function Description** || my.getServerTime | Get the server time. |

Capture Screen

||||---|---|| **API Name** | **Function Description** || my.onUserCaptureScreen | Listen to the capture screen event by users. || my.offUserCaptureScreen | Cancel the listen to the capture screen event by users. |

Screen Brightness

||||---|---|| **API Name** | **Function Description** || my.setKeepScreenOn | Set whether screen keeps awake. || my.getScreenBrightness | Get the screen brightness. || my.setScreenBrightness | Set the screen brightness. |

Screen Orientation

||||---|---|| **API Name** | **Function Description** || my.getScreenOrientation | Get screen orientation || my.setScreenOrientation | Set screen orientation |

Setting

||||---|---|| **API Name** | **Function Description** || my.openSetting | Open the mini program settings page. || my.getSetting | Obtain the user's current settings. |

Add Phone Contact

||||---|---|| **API Name** | **Function Description** || my.addPhoneContact | Add contact to phone contact. |

Permission Guide

||||---|---|| **API Name** | **Function Description** || my.showAuthGuide | Guide user to grant the authorization when the permission needed. |

Scan

||||---|---|| **API Name** | **Function Description** || my.scan | Call the scanning QR code function. |

Memory Warning

||||---|---|| **API Name** | **Function Description** || my.onMemoryWarning | Listen to the insufficient memory alarm event. || my.offMemoryWarning | Unlisten to the insufficient memory alarm event. ||

Battery Information

||||---|---|| **API Name** | **Function Description** || my.getBatteryInfo | Obtain the battery level and the charging state of the current device asynchronously. || my.getBatteryInfoSync | Obtain the battery level and the charging state of the current device synchronously. ||

Bluetooth

||||---|---|| **Reference** | **Description** || Bluetooth API Overview | Provide the system requirement and the process flow on how the Bluetooth APIs work. || Bluetooth API Error Code Table | List the normal error code and relative solutions. || Bluetooth API FAQ | FAQs about using Bluetooth API. ||

BLE

||||---|---|| **API Name** | **Function Description** || my.connectBLEDevice | Connect to low energy Bluetooth devices. || my.disconnectBLEDevice | Disconnect to low energy Bluetooth devices. || my.getBLEDeviceCharacteristics | Get the characteristics of low energy Bluetooth devices. || my.getBLEDeviceServices | Get all the low energy Bluetooth devices that are discovered, including the connected devices. || my.notifyBLECharacteristicValueChange | Enable the function to notify changes to the characteristic value. || my.offBLECharacteristicValueChange | Disable the function to notify changes to the characteristic value. || my.offBLEConnectionStateChanged | Disable the the event listener for the connection status. || my.onBLECharacteristicValueChange | Enable the event listener for changes to the characteristic value. || my.onBLEConnectionStateChanged | Enable the event listener for changes to the connection status, such as device lost and device disconnected. || my.readBLECharacteristicValue | Read the characteristic value. || my.writeBLECharacteristicValue | Write data to the characteristic value. ||

Bluetooth

||||---|---|| **API Name** | **Function Description** || my.closeBluetoothAdapter | Close the Bluetooth module in the mini program. || my.openBluetoothAdapter | Initialize the Bluetooth module in the mini program. || my.getBluetoothAdapterState | Check the Bluetooth adapter status in the mini program. || my.startBluetoothDevicesDiscovery | Start discovering Bluetooth devices. || my.stopBluetoothDevicesDiscovery | Stop discovering Bluetooth devices. || my.getBluetoothDevices | Get all the Bluetooth devices that are discovered, including those that are connected to the current device. || my.getConnectedBluetoothDevices | Get the Bluetooth devices that are connected. || my.onBluetoothDeviceFound | Use this API when a new Bluetooth device is found. || my.offBluetoothDeviceFound | Remove the Bluetooth devices that are found. || my.onBluetoothAdapterStateChange | Monitor the Bluetooth adapter state changes. || my.offBluetoothAdapterStateChange | Remove the Bluetooth adapter with a state change. ||

Sharing

||||---|---|| **API Name** | **Function Description** || [my.showSharePanel](#) | Trigger the sharing. |

Update

||||---|---|| **API Name** | **Function Description** || [my.getUpdateManager](#) | Create an [UpdateManager](#) object. |

web-view

||||---|---|| **API Name** | **Function Description** || [my.createWebViewContext](#) | By creating [webViewContext](#), mini program can send message to [web-view](#). This API will create a [webViewContext](#) instance. |

Site Info

||||---|---|| **API Name** | **Function Description** || [my.getSiteInfo](#) | Get the site information. |

Open Capabilities

||||---|---|| **API Name** | **Function Description** || [my.navigateToMiniProgram](#) | Jump to other mini program. || [my.navigateBackMiniProgram](#) | Return to the previous mini program, only when another mini program jumps to the current mini program. || [my.getAuthCode](#) | Get auth code. || [my.getOpenUserInfo](#) | Get basic information about user. || [my.tradePay](#) | Start to pay. || [my.signContract](#) | Sign the withholding contract. |

Basic

||||---|---|| **API Name | Function Description** || my.canIUse | Judge whether the current Mini Program API, incoming parameter or return value, component, attribute, etc. are supported in the current version. || my.SDKVersion | Get the SDK version. || my.getAppIdSync | Obtain the Mini Program App ID synchronously. || my.getRunScene | Obtain the running version of the current Mini Program. |

UI

NavigationBar

||||---|---|| **API Name | Function Description** || my.hideBackHome | Hide back to home button. || my.hideNavigationBarLoading | Hide navigation bar loading. || my.setNavigationBar | Set the navigation bar text and style. || my.showNavigationBarLoading | Show navigation bar loading. |

TabBar

||||---|---|| **API Name | Function Description** || my.hideTabBar | Hide the tabBar. || my.setTabBarStyle | Set the style of tabBar. || TabBar FAQ | The FAQ of TabBar. |

Route

||||---|---|| **API Name | Function Description** || my.switchTab | Jump to the specified tabBar page and close all other pages that are not tabBar. || my.navigateTo | Maintain the current page and jump to the specified page within the application. Use my.navigateBack to return to the original page. || my.reLaunch | Close all current pages and jump to the specified page within the application. || my.navigateBack | Close the current page and return to the previous one or more pages. || my.redirectTo | Close the current page and jump to the specified page within the application. |

FeedBack

||||---|---|| **API Name | Function Description** || my.alert | Alert box. || my.confirm | Confirm box. || my.prompt | Prompt box. || my.showToast | Show a weak hint, which disappears in the specified seconds. || my.hideToast | Hide the weak hint. || my.showLoading | Show the loading hint. || my.hideLoading | Hide the loading hint. || my.showActionSheet | Display an operation menu. |

Pulldown

||||---|---|| **API Name | Function Description** || onPullDownRefresh | On the Page, customize the onPullDownRefresh function to listen to the pull-to-refresh event of user. || my.stopPullDownRefresh | Stop the pull-to-refresh for the current page. || my.startPullDownRefresh | Start the pull-to-refresh function. |

Contact

||||---|---|| **API Name** | **Function Description** || my.choosePhoneContact | Choose contact from system contact. |

Choose Data

||||---|---|| **API Name** | **Function Description** || my.datePicker | Open a date selection list. |

Animation

||||---|---|| **API Name** | **Function Description** || my.createAnimation | Create an instance of animation. |

Canvas

||||---|---|| **API Name** | **Function Description** || my.createCanvasContext | Create the context of the canvas. |

Keyboard

||||---|---|| **API Name** | **Function Description** || my.hideKeyboard | Hide keyboard. |

Scroll

||||---|---|| **API Name** | **Function Description** || my.pageScrollTo | Scroll to the destination location of the page. |

SelectorQuery

||||---|---|| **API Name** | **Function Description** || my.createQuery | Create an instance of SelectorQuery. |

Multiple Level Select

||||---|---|| **API Name** | **Function Description** || my.multiLevelSelect | Multiple level selector, used for associated select with multiple levels. |

Set Background

||||---|---|| **API Name** | **Function Description** || my.setBackgroundColor | Set background color. |

Set Page Pulldown

||||---|---|| **API Name | Function Description** || my.setCanPullDown | Set whether page can support pulldown. |

Media

Image

||||---|---|| **API Name | Function Description** || my.chooseImage | Choose image from camera or album of cellphone. || my.previewImage | Preview image. || my.saveImage | Save the online images to cellphone album. || my.getImageInfo | Get the information of the image. |

Storage

||||---|---|| **API Name | Function Description** || my.setStorage | Store the data in the specified key in the local cache, which overlaps the original data corresponding to the key. || my.setStorageSync | Store synchronously the data in the specified key in the local cache. || my.getStorage | Get cached data. || my.getStorageSync | Get cached data synchronously. || my.removeStorage | Remove cached data. || my.removeStorageSync | Remove cached data synchronously. || my.clearStorage | Clear local data cache. || my.clearStorageSync | Clear local data cache synchronously. |

File

||||---|---|| **API Name | Function Description** || my.sendFile | Save file to the device. || my.getFileInfo | Get the information of the file. || my.getSavedFileInfo | Get the information of the saved file. || my.getSavedFileList | Get the information of all the saved file. || my.removeSavedFile | Remove the saved file. |

Location

||||---|---|| **API Name | Function Description** || my.getLocation | get the current geographical location of the user. |

Network

||||---|---|| **API Name | Function Description** || my.request | Network request. || my.uploadFile | Upload the local resource to the developer server. || my.downloadFile | Download file resource to local location. || my.connectSocket | Create a WebSocket connection. || my.onSocketOpen | Listen to the event of enabling the WebSocket connection. || my.offSocketOpen | Unlisten to the event of enabling the WebSocket connection. || my.onSocketError | Listen to WebSocket error events. || my.offSocketError | Unlisten to WebSocket error events. || my.sendSocketMessage | Send data over WebSocket connection. || my.onSocketMessage | Listen to the event of receiving server

messages by WebSocket. || my.offSocketMessage | Unlisten to the event of receiving server messages by WebSocket. || my.closeSocket | Close the WebSocket connection. || my.onSocketClose | Listen to the event of closing the WebSocket connection. || my.offSocketClose | Unlisten to the event of closing the WebSocket connection. |

Device

System Information

||||---|---|| **API Name** | **Function Description** || my.getSystemInfo | Get system information. |

Network Status

||||---|---|| **API Name** | **Function Description** || my.getNetworkType | Get the current network status. |

Clipboard

||||---|---|| **API Name** | **Function Description** || my.getClipboard | Get the clipboard data. || my.setClipboard | Set the clipboard data. |

Watch Shake

||||---|---|| **API Name** | **Function Description** || my.watchShake | The watchshake function. |

Accelerometer

||||---|---|| **API Name** | **Function Description** || my.onAccelerometerChange | Listen to the acceleration data event. || my.offAccelerometerChange | Unlisten to the acceleration data event. |

Compass

||||---|---|| **API Name** | **Function Description** || my.onCompassChange | Listen to the compass data change event. || my.offCompassChange | Unlisten to the compass data change event. |

Vibrate

||||---|---|| **API Name** | **Function Description** || my.vibrate | Invoke the vibrate ability of device. |

Make Phone Call

||||---|---|| **API Name** | **Function Description** || my.makePhoneCall | Make a phone call. |

Get Server Time

||||---|---|| **API Name** | **Function Description** || my.getServerTime | Get the server time. |

Capture Screen

||||---|---|| **API Name** | **Function Description** || my.onUserCaptureScreen | Listen to the capture screen event by users. || my.offUserCaptureScreen | Cancel the listen to the capture screen event by users. |

Screen Brightness

||||---|---|| **API Name** | **Function Description** || my.setKeepScreenOn | Set whether screen keeps awake. || my.getScreenBrightness | Get the screen brightness. || my.setScreenBrightness | Set the screen brightness. |

Setting

||||---|---|| **API Name** | **Function Description** || my.openSetting | Open the Mini Program settings page. || my.getSetting | Obtain the user's current settings. |

Add Phone Contact

||||---|---|| **API Name** | **Function Description** || my.addPhoneContact | Add contact to phone contact. |

Permission Guide

||||---|---|| **API Name** | **Function Description** || my.showAuthGuide | Guide user to grant the authorization when the permission needed. |

Scan

||||---|---|| **API Name** | **Function Description** || my.scan | Call the scanning QR code function. |

Memory Warning

||||---|---|| **API Name** | **Function Description** || my.onMemoryWarning | Listen to the insufficient memory alarm event. || my.offMemoryWarning | Unlisten to the insufficient memory alarm event. |

Battery Information

||||---|---|| **API Name** | **Function Description** || my.getBatteryInfo | Obtain the battery level and the charging state of the current device asynchronously. ||
my.getBatteryInfoSync | Obtain the battery level and the charging state of the current device synchronously. |

Bluetooth

||||---|---|| **API Name** | **Function Description** || Bluetooth API Error Code Table | List the normal error code and relative solutions. || Bluetooth API FAQ | FAQ about using Bluetooth API. |

BLE

||||---|---|| **API Name** | **Function Description** || my.connectBLEDevice | Connect to low energy bluetooth devices. || my.disconnectBLEDevice | Disconnect to low energy bluetooth devices. || my.getBLEDeviceCharacteristics | Get the characteristics of low energy bluetooth devices. || my.getBLEDeviceServices | Get all the low energy bluetooth devices that are discovered, including the connected devices. ||
my.notifyBLECharacteristicValueChange | Enable the function to notify changes to the characteristic value. || my.offBLECharacteristicValueChange | Disable the function to notify changes to the characteristic value. || my.offBLEConnectionStateChanged | Disable the the event listener for the connection status. ||
my.onBLECharacteristicValueChange | Enable the event listener for changes to the characteristic value. || my.onBLEConnectionStateChanged | Enable the the event listener for changes to the connection status , such as device lost and device disconnected. ||
my.readBLECharacteristicValue | Read the characteristic value. ||
my.writeBLECharacteristicValue | Write data to the characteristic value. |

Bluetooth

||||---|---|| **API Name** | **Function Description** || my.openBluetoothAdapter | Use this API to initialize the Bluetooth module in the mini program. || my.closeBluetoothAdapter | Use this API to close the Bluetooth module in the mini program. ||
my.getBluetoothAdapterState | Use this API to check the Bluetooth adapter status in the mini program. || my.startBluetoothDevicesDiscovery | Use this API to start discovering bluetooth devices. || my.stopBluetoothDevicesDiscovery | Use this API to stop discovering bluetooth devices. || my.getBluetoothDevices | Use this API to get all the bluetooth devices that are discovered, including those that are connected to the current device. || my.getConnectedBluetoothDevices | Use this API to get the bluetooth devices that are connected. || my.onBluetoothDeviceFound | Use this API when a new Bluetooth device is found. || my.offBluetoothDeviceFound | Use this API to remove the bluetooth devices that are found. || my.onBluetoothAdapterStateChange | Use this API to monitor the bluetooth adapter state changes. || my.offBluetoothAdapterStateChange | Use this API to remove the bluetooth adapter with a state change. |

web-view

||||---|---|| **API Name** | **Function Description** || my.createWebViewContext | By creating webViewContext, Mini Program can send message to web-view. This API will create a webViewContext instance |

Site Info

||||---|---|| **API Name** | **Function Description** || my.getSiteInfo | Get the site information. |

Open Capabilities

||||---|---|| **API Name** | **Function Description** || my.getAuthCode | Get auth code. || my.getOpenUserInfo | Get basic information about user. || my.tradePay | Start to pay. || my.navigateToMiniProgram | Jump to other Mini Program. || my.navigateBackMiniProgram | Return to the previous Mini Program, only when another Mini Program jumps to the current Mini Program. || my.signContract | Sign the withholding contract. || my.getPhoneNumber | Get the phone number. |

Experience Mini Program

Developers can use the Android Demo App to scan the QR code shown in the API documents.

Launching the User Interface {#launching-the-user-interface}

Last updated: 2022-07-03

Path: miniprogram_gcash

Launching the User Interface

2022-07-03 18:44

Prerequisites

Make sure you have created a developer account. For more information, see [Apply for an Account](#).

Features

When you launch the Mini Program Studio, you can do the following tasks in the user interface.

- Login
- Joined workspaces
- Create a new Mini Program
- Open an existing Mini Program
- Delete a Mini Program

For more information, see the demos below:

Login

The first time opening the Mini Program Studio, login is required. You can use the account that applied from Mini Program Developer Portal to login the Mini Program.

If password is forgot, try to retrieve the password in the [Mini Program Developer Portal](#).

Joined Workspaces

After login, you can see which workspaces you have joined in the left side of the launch interface.

A developer can join multiple workspaces by invitation of workspace admins, and Mini Programs are separated in different workspaces. So here you can develop different Mini Program project for different workspaces.

Create a New Mini Program

The first time opening the Mini Program, you can create a new Mini Program project. The Mini Program Studio has provided two ways to create a new Mini Program:

- Creating a Mini Program scaffold project, it contains basic files of a Mini Program.
- Creating a Mini Program from the provided templates, which provides the template codes and help you to complete the Mini Program quickly.

Creating Scaffold Project

By clicking the Add card in the launch interface, you can create a scaffold project. In the project setup page, you need to set up following properties:

- Project Name: Project name to be displayed in the Mini Program Studio. Space is not allowed in the name. We recommend you to use letters to set the a meaning name.
- Project Path: Location for saving the project in the disk.

After the setup of the properties, click the complete button to complete the creating of the Mini Program.

Creating Template Project

In the launch interface, there is a templates button. Click it, you can see there are three templates and there will be more templates in the future.

Choose a template then click Next. Then similar with creating a new Mini Program, set the name and path for the project and click Complete button to complete the creation process.

Open an Existing Mini Program

If you have created Mini Program project before, or you have a local Mini Program project which may from a git source, you can open it with the Open Project function.

Open Local Project

After clicking the Open Project button, a local selector will pop up, you need to select the root path of your local Mini Program project and then confirm the selection.

Open Recent Opened Project

If you have opened a Mini Program project before, it will show in the launch interface. You can click the card to open the project directly.

Delete Project

If you do not want the launch interface to show too many opened projects, you can right click the project card and then a delete popup will show, then you can remove it from the launch interface to make the interface clean.

Note: the delete function will not remove the local project files, only remove the entries in the launch interface.

Learn More About Todo App Demo

2022-07-03 18:44

Overview

We will introduce the development of a Mini Program in detail through the Todo App Demo.

Global Configuration

The `app.js` is the entry point to a Mini Program, you can configure the lifecycle of a Mini Program, declare global variables, and perform app initialization in this file. The following code snippet shows an example of calling APIs for storage and getting user

information. For more APIs, see [API document](#).

copy

```
// Call the storage API to get the stored data
const todos = my.getStorageSync({key:'todos'}).data || [
    { text: 'Learning Javascript', completed: true },
    { text: 'Learning ES2016', completed: true },
    { text: 'Learning Mini Program ', completed: false },
];

App({
    // Declare global data
    todos,

    userInfo: null,

    // Declare global method
    setTodos(todos) {
        this.todos = todos;
        // Call storage API to store data
        my.setStorageSync({key:'todos', data:todos});
    },

    getUserInfo() {
        return new Promise((resolve, reject) => {
            if (this.userInfo) resolve(this.userInfo);
            // Call user authorization API to get user info
            my.getAuthCode({
                success: (authcode) => {
                    console.info(authcode);

                    my.getAuthUserInfo({
                        scopes: ['auth_user'],
                        success: (res) => {
                            this.userInfo = res;
                            resolve(this.userInfo);
                        },
                        fail: () => {
                            reject({});
                        },
                    });
                },
                fail: () => {
                    reject({});
                },
            });
        },
    },
});
```

The `app.json` is the global configuration file of the Mini Program, where it is possible to configure the general navigation bar title, window background color and other configurations of the Mini Program. For more configurations, see [global configuration documentation](#).

copy

```
{
  "pages": [
    "pages/todos/todos",
    "pages/add-todo/add-todo"
  ],
  "window": {
    "defaultTitle": "Todo App"
  }
}
```

The `app.acss` is the global style of a Mini Program. The selectors defined in the `app.acss` can be applied to all pages in the Mini Program project.

copy

```
page {
  flex: 1;
  display: flex;
}
```

The page selector is a special selector supported by the framework, which works with the page root node container available in the framework.

Mini Program Page

We have two pages in this demo project: Todo List page and Add Todo page, both reside in the `pages` directory. All page paths of the Mini Program must be declared in the `app.json`, and a page path starts from the project root directory and should omit the filename extension. The very first path declared `app.json` is the home page of a Mini Program.

Each [Mini Program](#) page consists of four types of files under the same directory:

- JS logic script file with the `.js` extension
- Configuration file with the `.json` extension
- Style file with the `.acss` extension
- UI Layout file with the `.axml` extension.

Todo List Page

The `todos.axml` is the structure template file of the page:

copy

```
<view class="page-todos">
  <view class="user">
    <image class="avatar" src="{{user.avatar}}" background-size="cover"></image>
    <view class="nickname">{{user.nickName}}'s Todo List</view>
  </view>
  <view class="todo-items">
    <checkbox-group class="todo-items-group" onChange="onTodoChanged">
      <label class="todo-item" a:for="{{todos}}>
        <checkbox value="{{item.text}}" checked="{{item.completed}}>
      />
        <text class="{{item.completed ? 'checked' : ''}}>
{{item.text}}</text>
      </label>
    </checkbox-group>
    <view class="todo-item">
      <button onTap="addTodo">Add Todo</button>
    </view>
  </view>
</view>
```

This UI layout have built-in UI components such as `<view/>`, `<image/>`, `<text/>`, `<button/>`, `<label/>` and `<checkbox/>` to build up the page structure, and we use `a:for` attribute to perform list rendering which iterates the todos list and render a `label` for each todo data respectively.

For binding data, see [Data binding](#) document. For binding event, see [event handling](#) document.

The `todos.js` is the logic script file of the page:

copy

```
// Get global app instance
const app = getApp();

Page({
  data: {},
  onLoad() {
    // Get user information and render
    app.getUserInfo().then(
      user => this.setData({
        user,
      }),
    );
  },
  // Listen to lifecycle
  onShow() {
    // Render global data to current page
    this.setData({ todos: app.todos });
  },
});
```

```
// Event handler
onTodoChanged(e) {
    // Modify global data and re-render
    const checkedTodos = e.detail.value;
    app.setTodos(app.todos.map(todo => ({
        ...todo,
        completed: checkedTodos.indexOf(todo.text) > -1,
    })));
    this.setData({ todos: app.todos });
},
addTodo() {
    // Call page jump API for page jump
    my.navigateTo({ url: '../add-todo/add-todo' });
},
);
}
```

In this file, we have:

- Listen to and process the lifecycle function of the page (`onHide`, `onShow`, `onLoad`, `onUnload`, `onReady`).
- Get Mini Program app instance and other page instances (`getApp`, `getCurrentPages`).
- Declare and process data
- Respond to page interaction events, call APIs, etc.
- Attention here: the `app.todos` object is the global variable defined in `app.js`.

The `todos.acss` is the style file of the page:

copy

```
.page-todos {
    flex: 1;
    display: flex;
    flex-direction: column;
}

.user {
    display: flex;
    padding: 30px 30px 0 30px;
}

.avatar {
    width: 128rpx;
    height: 128rpx;
    margin-right: 40rpx;
    border-radius: 50%;
}

.nickname {
```

```

display: flex;
flex-direction: column;
justify-content: center;
font-size: 40rpx;
}

.todo-items {
  padding: 80rpx;
}

.todo-items-group {
  display: flex;
  flex-direction: column;
}

.checked {
  color: #d9d9d9;
  text-decoration: line-through;
}

.todo-item {
  margin-bottom: 15px;
}

```

The `acss` styling file is not mandatory. See [Style](#) document for `acss` file syntax. When a page has the style sheet, the style rule in the page style sheet overrides the style rules in the `app.acss`. If the style sheet is not specified for the page, it is also possible to directly use the style rules specified in `app.acss`.

The `todos.json` is the configuration file of the page. Here it is an empty file.

The configuration file is not mandatory. When a page has the configuration file, the configuration item overwrites the same configuration items in the window of `app.json`. If no page configuration file is specified, the page directly uses the default configuration in `app.json`. Therefore, the index page title is the Todo App specified for `app.json`.

Add Todo Page

The `add-todo.axml` is the structure template file of the page:

copy

```

<view class="page-add-todo">
  <view class="add-todo">
    <input
      class="add-todo-input"
      placeholder="What needs to be done?"
      onBlur="onBlur"
      value="{{inputValue}}"
    />
  </view>
  <view class="todo-footer">

```

```

<add-button text="Add Todo" onClickMe="add" ></add-button>
</view>
</view>

```

There are two core functions in the page:

1. Use the <input/> component to accept user input.
2. The <add-button> is a custom component. We can wrap the whole codes of some function into a custom component for easy reuse elsewhere.

`add-todo.js` page logic code:

copy

```

const app = getApp();

Page({
  data: {
    inputValue: '',
  },
  onBlur(e) {
    this.setData({
      inputValue: e.detail.value,
    });
  },
  add() {
    app.todos = app.todos.concat([
      {
        text: this.data.inputValue,
        completed: false,
      },
    ]);
    my.navigateBack();
  },
});

```

`add-todo.acss` is consistent with `todos.acss` usage and will not be described again.

Since the `add-todo.json` refers to a custom component, it should be declared in json, otherwise error will be reported:

copy

```

"usingComponents": {
  "add-button": "/components/add-button/add-button"
}

```

We will learn how to publish a Mini Program in the next tutorial.

Learn More About Todo App Demo

2021-05-09 18:43

Overview

We will introduce the development of a Mini Program in detail through the Todo App Demo.

Global Configuration

The `app.js` is the entry point to a Mini Program, you can configure the lifecycle of a Mini Program, declare global variables, and perform app initialization in this file. The following code snippet shows an example of calling APIs for storage and getting user information. For more APIs, see [API document](#).

copy

```
// Call the storage API to get the stored data
const todos = my.getStorageSync({key:'todos'}).data || [
  { text: 'Learning Javascript', completed: true },
  { text: 'Learning ES2016', completed: true },
  { text: 'Learning Mini Program ', completed: false },
];

App({
  // Declare global data
  todos,

  userInfo: null,

  // Declare global method
  setTodos(todos) {
    this.todos = todos;
    // Call storage API to store data
    my.setStorageSync({key:'todos', data:todos});
  },

  getUserInfo() {
```

```

        return new Promise((resolve, reject) => {
            if (this.userInfo) resolve(this.userInfo);
            // Call user authorization API to get user info
            my.getAuthCode({
                success: (authcode) => {
                    console.info(authcode);

                    my.getAuthUserInfo({
                        scopes: ['auth_user'],
                        success: (res) => {
                            this.userInfo = res;
                            resolve(this.userInfo);
                        },
                        fail: () => {
                            reject({});
                        },
                    });
                },
                fail: () => {
                    reject({});
                },
            });
        });
    },
);

```

The `app.json` is the global configuration file of the Mini Program, where it is possible to configure the general navigation bar title, window background color and other configurations of the Mini Program. For more configurations, see [global configuration documentation](#).

copy

```
{
  "pages": [
    "pages/todos/todos",
    "pages/add-todo/add-todo"
  ],
  "window": {
    "defaultTitle": "Todo App"
  }
}
```

The `app.acss` is the global style of a Mini Program. The selectors defined in the `app.acss` can be applied to all pages in the Mini Program project.

copy

```
page {
  flex: 1;
  display: flex;
}
```

The page selector is a special selector supported by the framework, which works with the page root node container available in the framework.

Mini Program Page

We have two pages in this demo project: Todo List page and Add Todo page, both reside in the `pages` directory. All page paths of the Mini Program must be declared in the `app.json`, and a page path starts from the project root directory and should omit the filename extension. The very first path declared `app.json` is the home page of a Mini Program.

Each Mini Program page consists of four types of files under the same directory:

- JS logic script file with the `.js` extension
- Configuration file with the `.json` extension
- Style file with the `.acss` extension
- UI Layout file with the `.axml` extension.

Todo List Page

The `todos.axml` is the structure template file of the page:

copy

```
<view class="page-todos">
    <view class="user">
        <image class="avatar" src="{{user.avatar}}" background-size="cover"></image>
        <view class="nickname">{{user.nickName}}'s Todo List</view>
    </view>
    <view class="todo-items">
        <checkbox-group class="todo-items-group" onChange="onTodoChanged">
            <label class="todo-item" a:for="{{todos}}>
                <checkbox value="{{item.text}}" checked="{{item.completed}}"/>
            <text class="{{item.completed ? 'checked' : ''}}>
                {{item.text}}</text>
            </label>
        </checkbox-group>
        <view class="todo-item">
            <button onTap="addTodo">Add Todo</button>
        </view>
    </view>
</view>
```

This UI layout have built-in UI components such as `<view/>`, `<image/>`, `<text/>`, `<button/>`, `<label/>` and `<checkbox/>` to build up the page structure, and we use `a:for` attribute to perform list rendering which iterates the todos list and render a `label` for each todo data respectively.

For binding data, see [Data binding](#) document. For binding event, see [event handling](#) document.

The `todos.js` is the logic script file of the page:

copy

```
// Get global app instance
const app = getApp();

Page({
  data: {},
  onLoad() {
    // Get user information and render
    app.getUserInfo().then(
      user => this.setData({
        user,
      }),
    );
  },
  // Listen to lifecycle
  onShow() {
    // Render global data to current page
    this.setData({ todos: app.todos });
  },
  // Event handler
  onTodoChanged(e) {
    // Modify global data and re-render
    const checkedTodos = e.detail.value;
    app.setTodos(app.todos.map(todo => ({
      ...todo,
      completed: checkedTodos.indexOf(todo.text) > -1,
    })));
    this.setData({ todos: app.todos });
  },
  addTodo() {
    // Call page jump API for page jump
    my.navigateTo({ url: '../add-todo/add-todo' });
  },
});
```

In this file, we have:

- Listen to and process the lifecycle function of the page (`onHide`, `onShow`, `onLoad`, `onUnload`, `onReady`).
- Get Mini Program app instance and other page instances (`getApp`, `getCurrentPages`).
- Declare and process data
- Respond to page interaction events, call APIs, etc.

- Attention here: the `app.todos` object is the global variable defined in `app.js`.

The `todos.acss` is the style file of the page:

copy

```
.page-todos {  
    flex: 1;  
    display: flex;  
    flex-direction: column;  
}  
  
.user {  
    display: flex;  
    padding: 30px 30px 0 30px;  
}  
  
.avatar {  
    width: 128rpx;  
    height: 128rpx;  
    margin-right: 40rpx;  
    border-radius: 50%;  
}  
  
.nickname {  
    display: flex;  
    flex-direction: column;  
    justify-content: center;  
    font-size: 40rpx;  
}  
  
.todo-items {  
    padding: 80rpx;  
}  
  
.todo-items-group {  
    display: flex;  
    flex-direction: column;  
}  
  
.checked {  
    color: #d9d9d9;  
    text-decoration: line-through;  
}  
  
.todo-item {  
    margin-bottom: 15px;  
}
```

The `acss` styling file is not mandatory. See [Style](#) document for `acss` file syntax. When a page has the style sheet, the style rule in the page style sheet overrides the style rules in the `app.acss`. if the style sheet is not specified for the page, it is also possible to directly

use the style rules specified in `app.acss`.

The `todos.json` is the configuration file of the page. Here it is an empty file.

The configuration file is not mandatory. When a page has the configuration file, the configuration item overwrites the same configuration items in the window of `app.json`. If no page configuration file is specified, the page directly uses the default configuration in `app.json`. Therefore, the index page title is the Todo App specified for `app.json`.

Add Todo Page

The `add-todo.axml` is the structure template file of the page:

copy

```
<view class="page-add-todo">
  <view class="add-todo">
    <input
      class="add-todo-input"
      placeholder="What needs to be done?"
      onBlur="onBlur"
      value="{{inputValue}}"
    />
  </view>
  <view class="todo-footer">
    <add-button text="Add Todo" onClickMe="add" ></add-button>
  </view>
</view>
```

There are two core functions in the page:

1. Use the `<input/>` component to accept user input.
2. The `<add-button>` is a custom component. We can wrap the whole codes of some function into a custom component for easy reuse elsewhere.

`add-todo.js` page logic code:

copy

```
const app = getApp();

Page({
  data: {
    inputValue: '',
  },
  onBlur(e) {
    this.setData({
      inputValue: e.detail.value,
    });
  },
  add() {
    app.todos = app.todos.concat([\
```

```

    {\ \
      text: this.data.inputValue,\ \
      compeleted: false,\ \
    },\ \
  ]); \
  my.navigateBack(); \
}, \
);

```

add-todo.acss is consistent with todos.acss usage and will not be described again.

Since the add-todo.json refers to a custom component, it should be declared in json, otherwise error will be reported:

copy

```
"usingComponents": { \
  "add-button": "/components/add-button/add-button" \
}
```

We will learn how to publish a Mini Program in the [next tutorial](#).

Lifecycle {#lifecycle}

Last updated: 2021-05-09

Path: miniprogram_gcash

Lifecycle

2021-05-09 18:43

Lifecycle Function

The lifecycle function of component is triggered by framework at special timing. Its detailed information is described in table below.

--- --- ---	Lifecycle	Parameter	Description
onInit	No	Trigger on component creation.	
deriveDataFromProps		Trigger on component creation and before update.	
nextProps		Trigger on component creation completion.	
didMount	No	Trigger on component creation completion.	
didUpdate	(prevProps,prevData)	Trigger on component update completion.	
didUnmount	No	Trigger on component deletion.	

onInit

The `onInit` is triggered on component creation. In `onInit`, it is possible to:

- Access such attributes as `this.is`, `this.$id` and `this.$page`
- Access `this.data` and `this.props`
- Access the custom attribute in component “methods”
- Call `this.setData` and `this.$spliceData` to modify data

Example 1:

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 0,
  },
  onInit() {
    this.setData({
      counter: 1,
      is: this.is,
    });
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
<view>{{is}}</view>
```

When the component is rendered on the page, the page output is as below:

copy

```
1
/components/counter/index
```

Example 2:

copy

```
// /components/counter/index.js
Component({
  onInit() {
    this.xxx = 2;
    this.data = { counter: 0 };
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
```

When the component is rendered on the page, the page output is as below:

copy

```
0
```

deriveDataFromProps

The deriveDataFromProps is triggered on component creation and update. In the deriveDataFromProps, it is possible to:

- Access such attributes as this.is, this.\$id and this.\$page
- Access this.data and this.props
- Access the custom attribute in component “methods”
- Call this.setData and this.\$spliceData to modify data
- Use the nextProps parameter to get the props parameter to be updated

Sample code:

Note

In this example, click the + button, and the counter on the page remains unchanged till the pCounter value is greater than 5.

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 5,
  },
  deriveDataFromProps(nextProps) {
    if (this.data.counter < nextProps.pCounter) {
      this.setData({
        counter: nextProps.pCounter,
      });
    }
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
```

copy

```
// /pages/index/index.js
Page({
  data: {
    counter: 1,
  },
  plus() {
    this.setData({ counter: this.data.counter + 1 })
  },
})
```

copy

```
<!-- /pages/index/index.axml -->
<counter pCounter="{{counter}}"/>
<button onTap="plus">+</button>
```

didMount

The didMount is the callback after the initial render of the custom component. Now the page has been rendered, and usually server end data is requested.

Sample code:

copy

```
Component({
  data: {},
  didMount() {
    let that = this;
    my.httpRequest({
      url: 'http://httpbin.org/post',
      success: function(res) {
        console.log(res);
        that.setData({name: 'Name Example'});
      }
    });
  },
});
```

didUpdate

The didUpdate is the callback after the update of custom component. It is called whenever the component data changes.

Sample code:

copy

```
Component({
  data: {},
```

```
    componentDidUpdate(prevProps, prevState) {
      console.log(prevProps, this.props, prevState, this.state);
    },
  );
}
```

Note:

- Internal call of **this.setData** in the component triggers componentDidUpdate
- External call of **this.setData** triggers componentDidUpdate, too

didUnmount

The didUnmount is the callback after the custom component deletion. It is called whenever the component instance is unloaded from the page.

Sample code:

copy

```
Component({
  data: {},
  didUnmount() {
    console.log(this);
  },
});
```

Component Lifecycle Illustration

Lifecycle

2022-07-03 18:44

Lifecycle Function

The lifecycle function of component is triggered by framework at special timing. Its detailed information is described in table below.

	Lifecycle	Parameter	Description
1	onInit	No	Trigger on component creation.
2	deriveDataFromProps	nextProps	Trigger on component creation and before update.
3	didMount	No	Trigger on component creation completion.
4	didUpdate	(prevProps,prevData)	Trigger on component update completion.
5	didUnmount	No	Trigger on component deletion.

onInit

The onInit is triggered on component creation. In onInit, it is possible to:

- Access such attributes as this.is, this.\$id and this.\$page
- Access this.data and this.props
- Access the custom attribute in component “methods”
- Call this.setData and this.\$spliceData to modify data

Example 1:

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 0,
  },
  onInit() {
    this.setData({
      counter: 1,
      is: this.is,
    });
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
<view>{{is}}</view>
```

When the component is rendered on the page, the page output is as below:

copy

```
1
/components/counter/index
```

Example 2:

copy

```
// /components/counter/index.js
Component({
  OnInit() {
    this.xxx = 2;
    this.data = { counter: 0 };
  },
})
```

copy

```
<!-- /components/counter/index.axml -->
<view>{{counter}}</view>
```

When the component is rendered on the page, the page output is as below:

copy

0

deriveDataFromProps

The deriveDataFromProps is triggered on component creation and update. In the deriveDataFromProps, it is possible to:

- Access such attributes as this.is, this.\$id and this.\$page
- Access this.data and this.props
- Access the custom attribute in component “methods”
- Call this.setData and this.\$spliceData to modify data
- Use the nextProps parameter to get the props parameter to be updated

Sample code:**Note**

In this example, click the + button, and the counter on the page remains unchanged till the pCounter value is greater than 5.

copy

```
// /components/counter/index.js
Component({
  data: {
    counter: 5,
  },
  deriveDataFromProps(nextProps) {
    if (this.data.counter < nextProps.pCounter) {
```

```

        this.setData({
            counter: nextProps.pCounter,
        });
    },
},
)

copy

<!-- /components/counter/index.axml -->
<view>{{counter}}</view>

copy

// /pages/index/index.js
Page({
    data: {
        counter: 1,
    },
    plus() {
        this.setData({ counter: this.data.counter + 1 })
    },
})

```

copy

```

<!-- /pages/index/index.axml -->
<counter pCounter="{{counter}}"/>
<button onTap="plus">+</button>

```

didMount

The didMount is the callback after the initial render of the custom component. Now the page has been rendered, and usually server end data is requested.

Sample code:

copy

```

Component({
    data: {},
    didMount() {
        let that = this;
        my.httpRequest({
            url: 'http://httpbin.org/post',
            success: function(res) {
                console.log(res);
                that.setData({name: 'Name Example'});
            }
        });
    },
});

```

didUpdate

The didUpdate is the callback after the update of custom component. It is called whenever the component data changes.

Sample code:

copy

```
Component({  
  data: {},  
  didUpdate(prevProps, prevState) {  
    console.log(prevProps, this.props, prevState, this.state);  
  },  
});
```

Note:

- Internal call of **this.setData** in the component triggers didUpdate
- External call of **this.setData** triggers didUpdate, too

didUnmount

The didUnmount is the callback after the custom component deletion. It is called whenever the component instance is unloaded from the page.

Sample code:

copy

```
Component({  
  data: {},  
  didUnmount() {  
    console.log(this);  
  },  
});
```

List Rendering {#list-rendering}

Last updated: 2021-05-09

Path: miniprogram_gcash

List Rendering

2021-05-09 18:43

a:for

Using `a:for` attribute on component can bind an array, and then the data in the array can be used to render the component repeatedly.

The current item in the array has a default subscript variable name `index`. The current item of the array has a default variable name `item`.

copy

```
<view a:for="{{array}}>
  {{index}}: {{item.message}}
</view>
```

copy

```
Page({
  data: {
    array: [\
      message: 'foo', \
    ], {\
      message: 'bar', \
    }],
  },
});
```

Use `a:for-item` to specify the variable name for the current element of the array. Use `a:for-index` to specify the current subscript variable name of the array.

copy

```
<view a:for="{{array}}" a:for-index="idx" a:for-item="itemName">
  {{idx}}: {{itemName.message}}
</view>
```

`A:for` supports nesting.

Below are the sample codes for the Multiplication Table nesting.

copy

```
<view a:for="{{[1, 2, 3, 4, 5, 6, 7, 8, 9]}}" a:for-item="i">
  <view a:for="{{[1, 2, 3, 4, 5, 6, 7, 8, 9]}}" a:for-item="j">
    <view a:if="{{i <= j}}>
      {{i}} * {{j}} = {{i * j}}
    </view>
  </view>
</view>
```

block a:for

Similar to block a:if, a:for can be used on the <block/> tag to render a structural block with multiple nodes.

copy

```
<block a:for="{{[1, 2, 3]}}">
  <view> {{index}}: </view>
  <view> {{item}} </view>
</block>
```

a:key

If the list item may change position dynamically or new item will be added into the list, and it is expected to maintain the features and state of the list item (such as the entry contents of <input/> and the checked status of <switch/>), the a:key should be used to specify the unique identifier of the list item.

The a:key value is provided in one of the two modes:

- String: Representing an attribute of the list item. The attribute value needs to be a unique string or number in the list, such as ID, and cannot change dynamically.
- Reserved keyword *this: Representing the list item itself. Moreover, it is the unique string or number. For example, when the change of the current data triggers re-rendering, the component with key will be rectified. The framework ensures they are reordered, but not recreated. In this way, the component can maintain its status, increasing the list rendering efficiency.

Note:

- If the a:key is not provided, it reports a warning.
- This can be ignored if it is known the list is static or the order is not concerned.

Below are the sample codes:

copy

```
<view class="container">
  <view a:for="{{list}}" a:key="*this">
    <view onTap="bringToFront" data-value="{{item}}">
      {{item}}: click to bring to front
    </view>
  </view>
</view>
```

copy

```
Page({
  data: {
    list: ['1', '2', '3', '4'],
  }
})
```

```

},
bringToFront(e) {
    const { value } = e.target.dataset;
    const list = this.data.list.concat();
    const index = list.indexOf(value);
    if (index !== -1) {
        list.splice(index, 1);
        list.unshift(value);
        this.setData({ list });
    }
},
});

```

key

The key is a more popular writing style than `a:key`, where any expression and string can be filled.

Note: The key can not be set on block.

Below are the sample codes:

copy

```
<view class="container">
    <view a:for="{{list}}" key="{{item}}>
        <view onTap="bringToFront" data-value="{{item}}>
            {{item}}: click to bring to front
        </view>
    </view>
</view>
```

copy

```
Page({
    data:{
        list:['1', '2', '3', '4'],
    },
    bringToFront(e) {
        const { value } = e.target.dataset;
        const list = this.data.list.concat();
        const index = list.indexOf(value);
        if (index !== -1) {
            list.splice(index, 1);
            list.unshift(value);
            this.setData({ list });
        }
    },
});

```

List Rendering {#list-rendering}

Last updated: 2022-07-03

Path: miniprogram_gcash

List Rendering

2022-07-03 18:44

a:for

Using `a:for` attribute on component can bind an array, and then the data in the array can be used to render the component repeatedly.

The current item in the array has a default subscript variable name `index`. The current item of the array has a default variable name `item`.

copy

```
<view a:for="{{array}}>
  {{index}}: {{item.message}}
</view>
```

copy

```
Page({
  data: {
    array: [\
      message: 'foo', \
    ], {\
      message: 'bar', \
    },
  },
});
```

Use `a:for-item` to specify the variable name for the current element of the array. Use `a:for-index` to specify the current subscript variable name of the array.

copy

```
<view a:for="{{array}}" a:for-index="idx" a:for-item="itemName">
  {{idx}}: {{itemName.message}}
</view>
```

A:for supports nesting.

Below are the sample codes for the Multiplication Table nesting.

copy

```
<view a:for="{{[1, 2, 3, 4, 5, 6, 7, 8, 9]}}" a:for-item="i">
  <view a:for="{{[1, 2, 3, 4, 5, 6, 7, 8, 9]}}" a:for-item="j">
    <view a:if="{{i <= j}}">
      {{i}} * {{j}} = {{i * j}}
    </view>
  </view>
</view>
```

block a:for

Similar to block a:if, a:for can be used on the <block/> tag to render a structural block with multiple nodes.

copy

```
<block a:for="{{[1, 2, 3]}}">
  <view> {{index}}: </view>
  <view> {{item}} </view>
</block>
```

a:key

If the list item may change position dynamically or new item will be added into the list, and it is expected to maintain the features and state of the list item (such as the entry contents of <input/> and the checked status of <switch/>), the a:key should be used to specify the unique identifier of the list item.

The a:key value is provided in one of the two modes:

- String: Representing an attribute of the list item. The attribute value needs to be a unique string or number in the list, such as ID, and cannot change dynamically.
- Reserved keyword `*this`: Representing the list item itself. Moreover, it is the unique string or number. For example, when the change of the current data triggers re-rendering, the component with key will be rectified. The framework ensures they are reordered, but not recreated. In this way, the component can maintain its status, increasing the list rendering efficiency.

Note:

- If the a:key is not provided, it reports a warning.
- This can be ignored if it is known the list is static or the order is not concerned.

Below are the sample codes:

copy

```
<view class="container">
  <view a:for="{{list}}" a:key="*this">
    <view onTap="bringToFront" data-value="{{item}}>
      {{item}}: click to bring to front
    </view>
  </view>
</view>
```

copy

```
Page({
  data:{
    list:['1', '2', '3', '4'],
  },
  bringToFront(e) {
    const { value } = e.target.dataset;
    const list = this.data.list.concat();
    const index = list.indexOf(value);
    if (index !== -1) {
      list.splice(index, 1);
      list.unshift(value);
      this.setData({ list });
    }
  },
});
```

key

The key is a more popular writing style than `a:key`, where any expression and string can be filled.

Note: The key can not be set on block.

Below are the sample codes:

copy

```
<view class="container">
  <view a:for="{{list}}" key="{{item}}>
    <view onTap="bringToFront" data-value="{{item}}>
      {{item}}: click to bring to front
    </view>
  </view>
</view>
```

copy

```
Page({
  data:{
    list:['1', '2', '3', '4'],
```

```

},
bringToFront(e) {
  const { value } = e.target.dataset;
  const list = this.data.list.concat();
  const index = list.indexOf(value);
  if (index !== -1) {
    list.splice(index, 1);
    list.unshift(value);
    this.setData({ list });
  }
},
);

```

List-secondary {#list-secondary}

Last updated: 2022-07-07

Path: miniprogram_gcash

List-secondary

2022-07-07 17:08

You can use the list-secondary component to display the additional information on the right side of the list item. The list-secondary component is placed in the **extra** slot. See [list-item](#) for details.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "List",
  "usingComponents": {
    "list": "mini-ali-ui/es/list/index",
    "list-item": "mini-ali-ui/es/list/list-item/index",
    "list-secondary": "mini-ali-ui/es/list/list-secondary/index"
  }
}
```

```

    }
}

```

.axml

copy

```

<list>
  <view slot="header">
    list header
  </view>
  <list-item thumb="http://thumb.link.png"
    arrow="{{true}}"
    onClick="onItemClick"
    upperSubtitle="upper subtitle"
    lowerSubtitle="lower subtitle" >
    main title
    <list-secondary
      title="secondary title"
      subtitle="secondary subtitle"
      thumb="http://thumb.url.jpg"
      thumbSize="20"
      slot="extra" />
  </list-item>
  <view slot="footer">
    list footer
  </view>
</list>

```

.js

copy

```

Page({
  onClick() {
    my.alert({
      content: 'click the event on list item'
    })
  }
})

```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || thumb | String | URL of thumbnail image. || title | String | Title. || subtitle | String | Subtitle. || thumbSize | String | Size of thumbnail image, which is required when *thumb* is specified. It is recommended to manually set the size. Otherwise, the image height is adjusted automatically, but might not be consistent with the text height. |

slots

Six slots are available for one list item. The following figure illustrates the name and position of each slot:

```
||||---|---|| Slot Name | Description || supporting | Header slot on the left side of the
list item. || default | Default slot, which is used to display the title. || afterTitle | Slot on
the right of the title, which is used to display lable or icon. || afterUpperSubtitle | Slot on
the right of the upper subtitle, which is used to display lable or icon. || afterLowerSubtitle
| Slot on the right of the lower subtitle, which is used to display lable or icon. || extra |
Slot on the right side of the list item, which is used to display additional information. |
```

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/extended-component_layout_secondlist

List-term {#list-term}

Last updated: 2022-07-03

Path: miniprogram_gcash

List-term

2022-07-03 18:44

You can use the list-item component to customize items in a list.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "List",
  "usingComponents": {
    "list": "mini-ali-ui/es/list/index",
    "list-item": "mini-ali-ui/es/list/list-item/index"
  }
}
```

.axml

copy

```

<list>
  <view slot="header">
    list header
  </view>
  <list-item thumb="http://thumb.link.png"
    arrow="{{true}}"
    onClick="onItemClick"
    upperSubtitle="upper subtitle"
    lowerSubtitle="lower subtitle" >
    main title
    <view slot="extra">
      additional information
    </view>
  </list-item>
  <view slot="footer">
    list footer
  </view></list>

```

.js

copy

```

Page({
  onItemClick() {
    my.alert({
      content: 'click the event on list item'
    })
  }
})

```

Parameters

||||| --- | --- | --- | --- | **Property | Type | Description** || arrow | Boolean | An indicator of whether to use an arrow. The default value is `true`. || thumb | String | URL of the thumbnail image. || index | String | The index that is used to record the position, which is returned in the event callback. || borderRadius | Boolean | An indicator of whether the list item is rounded. The default value is `false`. || upperSubtitle | String | Upper subtitle. || lowerSubtitle | String | Lower subtitle. || titlePosition | String | Title position. Valid values are:

- `top`
- `middle`
- `bottom`

The default value is `top`. || thumbSize | String | Size of thumbnail image, which is required if `thumb` is specified. The default value is `40 px`. || onClick | Function | The event that is triggered when users tap the list item. || last | Boolean | An indicator of whether to display a line under the list item. The default value is `false`.

slot

Six slots are available for one list item. The following figure illustrates the name and position of each slot:

||||---|---|| **Slot Name | Description** || supporting | Header slot on the left side of the list item. || default | Default slot, which is used to display the title. || afterTitle | Slot on the right of the title, which is used to display label or icon. || afterUpperSubtitle | Slot on the right of the upper subtitle, which is used to display label or icon. || afterLowerSubtitle | Slot on the right of the lower subtitle, which is used to display label or icon. || extra | Slot on the right side of the list item, which is used to display additional information. |

FAQ

How do I remove the line under the last list item?

If you want to remove the line under the last list item, set the value of *last* as true.

Source: https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/extended-component_layout_list-term

Long Password {#long-password}

Last updated: 2022-07-03

Path: miniprogram_gcash

Long Password

2022-07-03 18:44

You can use the long-password component to display the input box for the password.

Note:

The long-password is a controlled component. The component value needs to be obtained by the *onInput* event.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "verify-code",
  "usingComponents": {
    "long-password": "mini-ali-ui/es/long-password/index"
```

```

    }
}
```

.axml

copy

```
<view>
    <view style="margin-top: 10px;" />
    <view style="padding: 0 10px;">Long password box</view>
    <view style="margin-top: 10px;" />
    <long-password
        placeholder=""
        value="{{longPassword}}"
        clear="{{true}}"
        onInput="onInput"
        onClear="onClear" />
</view>
```

.js

copy

```
Page({
  data: {
    longPassword: '',
  },
  onInput(e) {
    this.setData({
      longPassword: e.detail.value,
    });
  },
  onClear() {
    this.setData({
      longPassword: '',
    });
  },
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || className | String | Customized class. || inputCls | String | Customized class for the input box that uses the [input](#) component. || last | Boolean | An indicator of whether the input box is the last one. The default value is `false`. || value | String | Initial content. || name | String | Component name, which is used to obtain data by submitting the form. || placeholder | String | Placeholder. || placeholderStyle | String | Style of the placeholder. || placeholderClass | String | Style class of the placeholder. || disabled | Boolean | An indicator of whether to disable the function of clearing the password. The default value is `false`. || maxlength | Number | Maximum length of the password. The default value is `140`. || focus | Boolean |

An indicator of whether to get focus. The default value is `false`.
|| `clear` | Boolean | An indicator of whether to clear the input. The default value is `true`, and takes effect only when the value of `disabled` is `false`.
|| `onInput` | (e: Object) => void | The event that is triggered when users tap the keyboard.
|| `onConfirm` | (e: Object) => void | The event that is triggered when users tap the **Done** button on the keyboard.
|| `onFocus` | (e: Object) => void | The event that is triggered when an element gets the focus.
|| `onBlur` | (e: Object) => void | The event that is triggered when an element loses the focus.
|| `onClear` | (e: Object) => void | The event that is triggered when users tap the **Clear** button.

Manage Mini Programs {#manage-mini-programs}

Last updated: 2022-07-07

Path: miniprogram_gcash

Manage Mini Programs

2022-07-07 17:08

The Mini Program Manage functionality is available for admins and developers to manage mini programs. Depending on your roles, you can perform different actions to manage your mini programs. Check this [video](#) to quickly get an overview of how to manage mini programs.

Admins, Reviewers, and Developers can manage mini programs with the highest authorization, while **Developers** have the authorization for their own mini programs. For more information about the roles, see [Member Role](#).

Features

Depending on your roles, you can benefit from all or some of the following features. Admins can manage all the mini programs with all the features, while reviewers, developer admins, and developers can view their mini programs by either adding members (as developers or admins) or done in the mini program development.

To be specific, you can benefit from the following features:

Create a new mini program

You can choose the mini program type and create a new mini program after you provide the required information. This feature is available for both admins and developers.

See [Create Mini Programs](#) for detailed steps.

Note:

See [Mini Program Types](#) to check the difference between the two types of mini programs.

To create a HTML5 mini program, see [How to transform an HTML 5 mobile app to an HTML 5 mini program](#).

Check mini programs in the list

You can check the mini programs in a list.

- Admins can check all the mini programs in the space.
- Other roles can check the authorized mini programs.

To be specific, you can:

- Check the basic information, such as name, type, ID, creator and last modified time of a mini program.
- View the performance and quality of each mini program and navigate to these pages:
 - [Performance](#)
 - [Real-time analysis](#)
 - [Quality](#)

Navigate to the detail page of the mini program

You can search for the mini program by mini program name, mini program ID, or creator. You click one specific mini program in the list and navigate to the detail page to check the following features:

- Information
- Versions
- Members
- Features
- QR Code
- Configuration

Manage a selected mini program in the detail page

To be specific, you can:

- Information
 - admins can modify or update the mini program information that is provided when you create the mini program. In addition, you can use multi-languages to describe your mini program information to localize the mini program.
- Other roles can view the information.
- Versions

You can check the version list of the mini program and filter mini programs by status. By selecting one specific version, you can check the detailed version information, JSAPIs that are used in the mini program, and the release progress. admins can also add release notes under **Version Info > Release Note** and submit an approval request to publish the version.

- Members
 - admins can add members to join the mini program project and remove members from the project to develop, debug, release and manage mini programs.
 - Set the member to either of the following roles:
 - Developer Admin
 - Developer
 - Other roles can view the member information.
 - Features

The feature is a package that contains JSAPIs that are used in the mini program. You can view the feature list. By selecting a specific feature, you can view all the JSAPIs contained in the feature.

In addition, developer admins can also add or delete features.

- QR Code

This feature is available for admins. You can take the following actions to the QR code:

- Display a default QR code for testing, which will disappear after a period of time as shown below the QR code.
- Define a new QR code with the URL and Page Parameters.
- Delete the default QR codes.
- Check the details of a QR code.
- Download a QR code.
- Configuration
 - admins can configure the client ID, the merchant ID, and whitelists.
 - Admins can view the configured information.

Remove the mini program

You can send your removal request of the mini program. After the removal request is approved, you can remove the mini program.

Note:

This feature is only available for admins.

Manage apps

2022-07-07 17:08

With the App Manage functionality, you can view app information and manage apps. This functionality is available for workspace admins.

Features

You can benefit from the following features:

- Create a new app

You can create a new app after you provide the required information.

- Check app information

You can check the information of one specific app, which includes:

- **Mini Program Accessing Key (RSA-2048)**: A unique key that allows container SDKs to access mini program data through SaaS.
- **Offline Package RSA Public Key**: The public key that is used by the app to verify the signature after downloading the offline package.

- **Android App Package Name:** The Android app package name. This field is required for Android app.
- **Android App Minimum Support OS Version:** The minimum OS version that the Android app supports. This field is required for Android app.
- **iOS App Bundle ID:** The iOS app bundle ID. This field is required for iOS app.
- **iOS App Minimum Support OS Version:** The minimum OS version that the iOS app supports. This field is required for iOS app.
- **Manage the app**

You can modify the app information and delete the app.

Manage workspace

2022-07-07 17:08

The Workspace Manage functionality is available for workspace admins and developer admins. Depending on your roles, you can perform different actions to manage the workspace.

Features

The following features are available for workspace admins under **Workspace**:

- Check workspace admins

You can check all other workspace admins.

- Manage the tenant workspace

You can check the following information about the tenant workspace under **Tenant Workspace** and change the information by sending us an email.

- **Workspace ID:** The unique ID that is assigned by the Mini Program Development Platform to identify a workspace.
- **Workspace Name:** Name of the tenant workspace.
- **Status:** Workspace status that identifies whether the workspace is verified by AIMPDP.
- **Business Address:** The company address that is used for the registration.
- **Business representative:** Name of legal representative.
- **Representative email:** Email address of legal representative.

Figure 1. Workspace admins manage the tenant workspace

- Manage the developer workspace

Workspace admins can check the list of developer workspaces under **Developer Workspaces**, which includes the following information:

- **Workspace Name:** Name of the developer workspace.
- **Company Name:** Name of the merchant company.
- **Number of Mini Programs:** Number of mini programs in the developer workspace.
- **Action:** The action that is taken to the developer workspace.
- Workspace admins can remove the developer workspace only when there's neither published mini program, nor any upload of mini programs into the workspace in the past 30 days.
- Workspace admins can view details of the developer workspace.

Figure 2. Workspace admins manage developer workspaces

The following features are available for developer admins under **Developer Workspace**:

- Check the workspace admins
- Check the workspace details, such as creation time, workspace ID, workspace name and status.
- Check the details of your business information, such as business address, scope of business, and contact email address.

Figure 3. Developer admins check the developer workspace info

MapContext Overview {#mapcontext-overview}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext Overview

2022-07-03 18:44

Call [my.createMapContext](#) to obtain a MapContext instance. A MapConext instance is bound with a map component through its ID. Manipulate the corresponding [map component](#) through MapContext.

Methods

||||---|---|| **Option | Description** || [MapContext.clearRoute](#) | Clear the walking route on the map. || [MapContext.gestureEnable](#) | Enable or disable all gestures. || [MapContext.getCenterLocation](#) | Get the center location of the current map. || [MapContext.moveToLocation](#) | Display the pinned location at the center of the map and restore the default zoom level. Use this method together with the *show-location* method of the map component. || [MapContext.showRoute](#) | Show the default walking route planned. Only one route is displayed. || [MapContext.showsCompass](#) | Set the visibility of the compass. || [MapContext.updateComponents](#) | Update the map API incrementally. |

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_map_mapcontext_overview

MapContext.clearRoute {#mapcontextclearroute}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.clearRoute

2022-07-03 18:44

Clear the walking route on the map.

Sample code

copy

```
this.mapCtx = my.createMapContext('map');
this.mapCtx.clearRoute();
```

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_map_clearroute

MapContext.gestureEnable {#mapcontextgestureenable}

Last updated: 2022-07-04

Path: miniprogram_gcash

MapContext.gestureEnable

2022-07-04 03:44

Enable or disable all gestures.

- 1: enable all gestures.
- 0: disable all gestures.

Parameter~~~~

--- --- --- ---	Property	Type	Required	Description		isGestureEnable	
Int Yes An indicator of whether the gestures are enabled.							

Sample code

copy

```
this.mapCtx = my.createMapContext('map');
this.mapCtx.gestureEnable({isGestureEnable:1});
```

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_map_gestureenable

MapContext.getCenterLocation {#mapcontextgetcenterlocation}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.getCenterLocation

2022-07-03 18:44

Get the center location of the current map.

Parameters~~~~

--- --- --- ---	Property	Type	Required	Description		success	Function
No The callback method that indicates a successful call.	fail	Function	No The				
callback method that indicates a failed call.	complete	Function	No The				
callback method that indicates the call is completed (this will be executed regardless of whether							
the call succeeds or fails).							

Success callback function

The parameters are in object type and have the following properties:

--- --- ---	Property	Type	Description		longitude	Number Longitude.
latitude	Number	Latitude.				

Sample code

copy

```
// .js
this.mapCtx = my.createMapContext('map');
this.mapCtx.getCenterLocation({
success: res => {
my.alert({
    content: 'longitude:' + res.longitude + '\nlatitude:' +
res.latitude,
});
console.log(res.longitude);
console.log(res.latitude);
}
});
});
```

Source:

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_map_getcenterlocation

MapContext.moveToLocation {#mapcontextmovetolocation}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.moveToLocation

2022-07-03 18:44

Display the pinned location at the center of the map and restore the default zoom level.
Use this API together with the show-location method of the map component.

Sample code

copy

```

MapContext.showRoute {#mapcontextshowroute}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.showRoute

2022-07-03 18:44

Get the default walking route planned. Only one route is displayed.

Note:

The IDE simulator cannot obtain the return values. Use the real development environment to obtain the return values.

Parameters ~~~~

||||| --- | --- | --- | --- || **Property** | **Type** | **Required** | **Description** || searchType | String

| No | Valid values are:

- walk: walking
- bus: public transit
- drive: driving
- ride: bicycling

The default value is **walk**. || startLat | Number | Yes | The latitude of the start point. || startLng | Number | Yes | The longitude of the start point. || endLat | Number | Yes | The latitude of the end point. || endLng | Number | Yes | The longitude of the end point. || throughPoints | Array | No | A set of points on the route. It is only available for driving guidance, that is, available when the value of

searchType is **drive**. || routeColor | HexColor | No | The color of the route. This parameter takes effect only in 2D maps. || iconPath | String | No | The texture of the route. In base library v1.11.0 and earlier versions, this parameter takes precedence over **routeColor** in 3D maps. Routes are covered by texture instead of a solid color. It's suggested that this parameter is not specified in base library v1.13.0 and later versions, because a default texture pattern is provided in 3D maps. It's also suggested to set the size of the image to an integer power of 2, such as 64*64. || iconWidth | Int | No | The width of the texture. This parameter takes effect only in base library v1.11.0 and earlier versions. It's suggested that this parameter is not specified in base library v1.13.0 and later versions, because a default texture width is set in 3D maps. || routeWidth | Int | No | The width of the route. This parameter takes effect only when texture is not used. It's suggested that this parameter is not specified in base library v1.13.0 and later versions, because a default value is set in 2D maps and it is no longer required in 3D maps. || zzIndex | Int | No | The Z-axis index of the overlay. || mode | Int | No | Only supported for driving and public transit modes. See [Mode values](#) for details. || city | String | Yes | Required in the public transit mode. || destinationCity | String | Yes | Required in the cross-city public transit mode. |

Mode values

||||| --- | --- | --- || **Mode** | **Bus** | **Drive** || 0 | Fastest route | Speed first (time). || 1 | Most economical route | Least cost (Choose the fastest toll-free route.) || 2 | Minimum transfers | Shortest distance. || 3 | Shortest walking distance | Avoid expressways. || 4 | Coziest route | Real-time route planning (to avoid traffic jams). || 5 | Avoid subway | Multiple strategies (comprehensively considering the speed first, least cost, and shortest distance strategies). || 6 | - | Avoid highways. || 7 | - | Avoid highway and toll roads. || 8 | - | Avoid toll roads and traffic jams. || 9 | - | Avoid highways, toll roads, and traffic jams. |

Success callback function

The type of the incoming parameter is Object with the following attributes:

||||| --- | --- | --- || **Property** | **Type** | **Description** || success | Boolean | Indicates whether the API operation is successful. || distance | Number | Distance. || duration | Number | Time in seconds. |

Sample code

copy

```
//.js
onReady() {
// Call my.createMapContext to obtain the map context.
this.mapCtx.showRoute({
    searchType: "walk",           // searchType: "walk", "bus", "drive",
"ride". Default value: walk. Added in v10.1.50.
    startLat: 1.339712,          // The latitude of the start point.
    startLng: 103.855457,         // The longitude of the start point.
    endLat: 1.342983,            // The latitude of the end point.
    endLng: 103.867935,          // The longitude of the end point.
    throughPoints: [{ lat: 1.343573, lng: 103.861916 }], // A set of
points on the route. It is only available for driving planning, that
is, available when searchType="drive". Added in v10.1.50.
    routeColor: '#FFB90F',        // The color of the route. This
parameter takes effect only in 2D maps in versions later than 10.1.50.
    iconWidth: 10,                // The width of the texture. In v10.1.35,
this parameter takes effect only when iconPath is specified. We
recommend that you do not specify this parameter in v10.1.50. A
default texture width is set in 3D maps.
    routeWidth: 10,                // The width of the route. This parameter
takes effect when texture is not used. We recommend that you do not
specify this parameter in v10.1.50, because a default value is set in
2D maps and it is no longer required in 3D maps.
    zIndex: 4,                   // The z-axis index of the overlay 10.1.35
    mode: 0,                     // Only supported in driving and public
transit modes. For more information about its values, see the mode
values list below.
```

```

    city: 'Singapore',           // Required in public transit mode.
    destinationCity: 'Singapore', // Required in cross-city public
transit mode.
    success: method(res) {
      console.log(res, 2323)
    }
  });
  console.log(1121)
},
onLoad() {
//  this.mapCtx = my.createMapContext('map');
this.mapCtx = my.createMapContext('map');
this.setData({
  includePoints:[ {\
    latitude: 1.347016,\n
    longitude: 103.860167,\n
  },{\\
    latitude: 1.351628,\n
    longitude: 103.863718,\n
  }]
})
}
}

copy

//.axml
<map
  id="map"
  customMapStyle="light"
  longitude="{{longitude}}"
  latitude="{{latitude}}"
  scale="{{scale}}"
  controls="{{controls}}"
  onControlTap="controltap"
  markers="{{markers}}"
  onMarkerTap="markertap"
  polyline="{{polyline}}"
  polygon="{{polygon}}"
  circles="{{circles}}"
  onRegionChange="regionchange"
  onTap="tap"
  onCalloutTap="callouttap"
  show-location style="width: 100%; height: 200px;"\n
  include-points="{{includePoints}}"
  ground-overlays="{{ground-overlays}}>

```

Sample of the success callback function

MapContext.showsCompass {#mapcontextshowscompass}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.showsCompass

2022-07-03 18:44

Set the visibility of the compass.

- 1: visible.
- 0: invisible.

Parameter

The parameter is in object type and has the following property:

Property	Type	Required	Description
isShowsCompass	Int	Yes	An indicator of whether the compass is visible.

Sample code

copy

```
this.mapCtx = my.createMapContext('map');
this.mapCtx.showsCompass({isShowsCompass:1});
```

https://miniprogram.gcash.com/docs/miniprogram_gcash/mpdev/api_map_showcompass

MapContext.updateComponents {#mapcontextupdatecomponents}

Last updated: 2022-07-03

Path: miniprogram_gcash

MapContext.updateComponents

2022-07-03 18:44

Update the map API incrementally.

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || latitude | Number | The latitude of the center location. || longitude | Number | The longitude of the center location. || scale | Number | Zoom level. The value ranges from 5 to 18. The default value is 16. || markers | Array | Point markers that overlay the map. || polyline | Array | A set of consecutive points (a route) that overlays the map. || include-points | Array | Slightly zoom out the map to include these points. || include-padding | Object | Show the map inside the area that includes paddings. || settings | Object | The settings. || command | Object | The command to update the marker animation. |

Sample code

copy

```
this.mapCtx = my.createMapContext('map');
this.mapCtx.updateComponents({
  scale: 14,
  longitude: 103.863718,
  latitude: 1.351628,
  command: {
    // Marker animation
    markerAnim: [\[
      {\ \
        type:0      // Jumping animation\
        markerId:xxx,\ \
      }\ \
    ],\ \
  },
  setting: {
    // Gesture
    gestureEnable:0/1,
    // Scale
```

```

showScale:0/1,
// Compass
showCompass:0/1,
// Tilt gestures with both hands
tiltGesturesEnabled:0/1,
// Show or hide traffic
trafficEnabled:0/1,
// Points of interest on the map
showMapText:0/1,
// Location of Amap logo
logoPosition:{centerX:150, centerY:90},
},
markers:[{},{}],
polyline:[{},{}],
include-points:[{},{}],
include-padding:{left:0, right:0, top:0, bottom:0},
});

```

Mask {#mask}

Last updated: 2022-07-03

Path: miniprogram_gcash

Mask

2022-07-03 18:44

You can use the mask component to display the pop-up element with a mask.

Sample code

See the sample codes in different languages:

.json

copy

```
{
  "defaultTitle": "Mask",
  "usingComponents": {
    "mask": "mini-ali-ui/es/mask/index"
  }
}
```

```

    }
}
```

.axml

copy

```
<mask type="{{type}}" show="{{show}}" maskZindex="{{maskZindex}}"
onMaskTap="maskClick"></mask>
```

.js

copy

```
Page({
  data: {
    type: 'market',
    maskZindex: 10,
  },
  maskClick() {
    if (this.data.type === 'market') {
      this.setData({
        type: 'product',
      });
    } else {
      this.setData({
        type: 'market',
        show: false,
      });
    }
  },
});
```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || type | String | The mask with different opacity. Valid values are:

- product: the pop-up element to display information about the product, with the opacity value of 0.55.

- market: the pop-up element to display information about the marketing, with the opacity value of 0.75.

The default value is product. || maskZindex | Number | The z-index property of the customized mask. || show | Boolean | An indicator of whether to display the mask. || onMaskTap | EventHandle | The event that is triggered when users tap the mask. The default value is () => {} . || fixMaskFull | Boolean | An indicator of whether to solve the incomplete display of the mask affected by transformation. The default value is false. |

Members {#members}

Last updated: 2024-12-24

Path: miniprogram_gcash

Members

2024-12-24 21:43

You can use this feature to manage members in a workspace. You can invite members and assign different roles to these members to perform different activities in the workspace.

This feature is available for workspace admins and developer admins.

Features

You can perform the following actions:

- Add new members by sending invitation with the following details:
 - Name

- Email address
- Role: You can set the following roles:
 - Workspace Developer
 - Workspace Admin
 - Workspace Reviewer
- Check the members in a list with the following details
 - User
 - Role
 - Developer Workspace
 - Status
 - Start Date
- Action: You can take the following actions to a member:
 - Resend the invitation
 - Withdraw the invitation
 - Delete members

Workspace admins can delete a member from the workspace and the member has no access to the workspace.

- Block the role of a member and unblock the role

Figure 1. Workspace admins manage members

The following features are located in the mini program detail page:

- Add a member by choosing a member from the list, which is defined in the Member page.
- Change the role of a member

You can set the role as either developer or admin.

- Delete a member.

For more information, see Member in [Manage Mini Programs](#).

Figure 2. Developer admins manage members

Merchant onboarding

2023-01-30 16:02

This topic is intended for merchants/ISVs to know how to complete the onboarding process to the Mini Program Platform. See the product guide [Using Mini Program Platform](#) for more information.

Quick overview

As an Merchant, you can the following onboarding process as illustrated below:

The onboarding process consists of the following procedures:

1. [Apply for an account](#)

Go to the Mini Program portal and enter your basic contact information to apply for an account.

2. [Know Your Business \(KYB\)](#)

Submit your business information for the wallet to conduct the Know Your Business (KYB) project.

3. [Approval process](#)

Submit your registration and wait for your wallet's approval email notification.

4. [Log in to the platform](#)

Log into the Mini Program Platform to manage mini programs.

Prerequisites

The merchant must become a partner of the wallet first. After that, the merchant contacts the wallet for the mini program platform address and starts to sign up.

Also, make sure the wallet has finished the onboarding process. See [Wallet onboarding](#) for details.

Procedures

The merchant/ISV onboarding process consists of the following steps.

1. Apply for an account

Contact the wallet for the link to the Mini Program Platform. By clicking the link within the invitation email you received, create your account as below:

Enter your contact information, and the account creation process is completed.

2. KYB

After you register your account, you'll then be redirected to the Know Your Business page.

Enter the required information, and click **Submit**.

3. Apply for the approval

After you submit the approval request, the wallet admin will review and process your request. When the request is approved, you will receive a notification email.

4. Log in to the platform

Use your account to sign in to the wallet's mini program platform and start to create your mini program.

Now your onboarding process is finished. You can start to create mini programs.

Next steps

Check this [Video Tutorial for the Mini Program Platform](#) to get started with mini programs.

Or go to the product guide [Using Mini Program Platform](#) to explore the functionalities.

        buttonText: "Main operation"
      },
      subButton: {
        buttonText: "Auxiliary operation"
      }
    },
    goBack() {
      my.navigateBack();
    }
  );
});
```

Attributes

	Property	Description	Type	Default	Required
className	Customized class.	String	-	No	type

Five status types include success, fail, info, warn and waiting, success by default.

	Property	Description	Type	Default	Required
subTitle	Sub title.	String	-	No	mainButton

Text of the main button is related with the availability.

	Property	Description	Type	Default	Required
disabled	Object<buttonText, disabled>	-	No	subButton	

Text of the auxiliary button is related with the availability.

	Property	Description	Type	Default	Required
disabled	Object<buttonText, disabled>	-	No	onTapMain	Click function of the main button.

`() => {}`

	Property	Description	Type	Default	Required
disabled	Object<buttonText, disabled>	-	No	onTapSub	Click function of the auxiliary button.

`() => {}`

Message encoding

2022-07-03 18:44

To prevent errors or ambiguity caused by special characters enclosed in a message, need to properly encode the message before message is transmitted.

||||---|---|| **Encoding scenarios | Encoding method** || For the byte data, such as the signature and the encrypted content, encode the data with the base64 algorithm before transmitting. | Use the `base64UrlEncode` function to encode data when calculating to generate a signature. || For the HTTPS URL data, perform URL encoding first before transmitting.

For example:

- Original URL: <https://www.merchant.com/authorizationResult>
- Encoded URL: `https%3A%2F%2Fwww.merchant.com%2FauthorizationResult` |

Method and Attribute {#method-and-attribute}

Last updated: 2021-05-09

Path: miniprogram_gcash

Method and Attribute

2021-05-09 18:43

Component Methods

The custom component can not only render static data but also respond to user click event, so as to handle and trigger custom component re-render. In the methods, it is possible to define any customized method.

Note:

Different from Page, the custom component needs to define the event handler in the methods.

Modify component axml:

copy

```
// /components/counter/index.axml
<view>{{counter}}</view>
<button onTap="plusOne">+1</button>
```

Handle event in component js:

copy

```
// /components/counter/index.js
Component({
  data: { counter: 0 },
  methods: {
    plusOne(e) {
      console.log(e);
      this.setData({ counter: this.data.counter + 1 });
    },
  },
});
```

Now the page renders an additional button. Each click on it will increase the page number by 1.

Props

Custom component is not isolated from the outside. By now, the example is a standalone module. To make it interact with the outside, the custom component can accept external input. After processing is done, it can notify the outside with “Done”. All those can be implemented with props.

Example:

Note:

- The props is the attribute transferred from outside. It is possible to specify default attribute, and cannot modify in the internal codes of the custom component.
- In the custom component axml, it is possible to refer to the props attribute directly.

- For the event in the custom component axml, only the method in the “methods” of the js of the custom component can respond. If it is required to call the function transferred from the parent component, it is possible to call it via this.props in the methods.

copy

```
// /components/counter/index.js
Component({
  data: { counter: 0 },
  props: {
    onCounterPlusOne: (data) => console.log(data),
    extra: 'default extra',
  },
  methods: {
    plusOne(e) {
      console.log(e);
      const counter = this.data.counter + 1;
      this.setData({ counter });
      this.props.onCounterPlusOne(counter); // Response to the event
      in axml can be through the method in "methods" only
    },
  },
});
```

The above codes set default attributes for props, and then the event handler get those attributes via **this.props**.

copy

```
// /components/counter/index.axml
<view>{{counter}}</view>
<view>extra: {{extra}}</view>
<button onTap="plusOne">+1</button>
```

External use: do not transfer props

copy

```
// /pages/index/index.axml
<my-component />
```

Page output:

copy

```
0
extra: default extra
+1
```

Now no parameter is transferred, so the page shows the default configured for props in the component js.

External use: transfer props

Note:

When custom component is used externally, if the transfer parameter is a function, the “on” suffix is necessary; otherwise it will be processed as a string.

copy

```
// /pages/index/index.js
Page({
  onCounterPlusOne(data) {
    console.log(data);
  }
});
```

copy

```
// /pages/index/index.axml
<my-component extra="external extra"
onCounterPlusOne="onCounterPlusOne" />
```

Page output:

copy

```
0
extra: external extra
+1
```

Here parameter is transferred, so the page shows the extra value transferred externally “external extra”.

Mini Program Javascript Engine {#mini-program-javascript-engine}

Last updated: 2022-07-03

Path: miniprogram_gcash

Mini Program Javascript Engine

2022-07-03 18:44

Running Engine

Mini program JavaScript codes fall into logic layer script and sjs script, which run on different threads in the the same JavaScript engine. Mini Program JavaScript Engine is different on different OSs. On the iOS platform, the script runs on the JavaScriptCore provided by the operating system. On the Android platform, the script runs on the V8 engine .

Mini program performs the babel conversion for the codes uploaded by the developers, so that the JavaScript engine supports most of the ES6 new features. For the internal object of the ES6 extension, Mini Program does not provide polyfill on the JavaScript engine, which causes difference on the supports for different ES6 extension internal objects for the JavaScript on different platforms. the developers need to avoid using the internal objects unsupported by JavaScript engine, and can provide polyfill for the internal objects. (Polyfill means the unsupported raw API codes that are used to implement browsers or other JavaScript engines, such as babel-polyfill)

Supports of Client OSs for ES6 Extension Internal Objects

The table below lists the OS supports for ES6 extension internal objects.

	Object	iOS 9	iOS 10 and above	Android
Object.is	Support	Support	Support	Support
Object.assign	Support	Support	Support	Support
Object.keys	Support	Support	Support	Support
Object.getOwnPropertyDescriptor	Support	Support	Support	Support
Object.getOwnPropertyNames	Support	Support	Support	Support
Object.getOwnPropertySymbols	Support	Support	Support	Support

	String	iOS 9	iOS 10 and above	Android
String.prototype.codePointAt	Support	Support	Support	Support
String.prototype.normalize	No support	Support	Support	Support
String.prototype.includes	Support	Support	Support	Support
String.prototype.startsWith	Support	Support	Support	Support
String.prototype.endsWith	Support	Support	Support	Support
String.prototype.repeat	Support	Support	Support	Support
String.fromCodePoint	Support	Support	Support	Support

	Array	iOS 9	iOS 10 and above	Android
Array.prototype.copyWithin	Support	Support	Support	Support
Array.prototype.findIndex	Support	Support	Support	Support
Array.prototype.find	Support	Support	Support	Support
Array.prototype.entries	Support	Support	Support	Support

Support Support	Reflect	Support Support	Promise Support Support
Support			

Limitations on Dynamic Execution Script

For sake of security, Mini Program limits some of the syntax and APIs of ES.

- It does not support eval using
- setTimeout and setInterval functions, and supports only the function for callback parameters. Dynamic execution of codes is not supported.
- It does not support using new Function to create a function.

Reserved Words of Module Name

The logic layer of Mini Program supports the ES2015 module syntax but regards some internal object names (such as window and document) of browser as the reserved words for emergency needs in the future. Those reserved words cannot be used as the module name. The reserved words include `globalThis`, `global`, `fetch`, `self`, `window`, `document`, `location` and `XMLHttpRequest`. For more details, see the descriptions of module name reserved words in [framework description](#).

Mini Program Operation Mechanism {#mini-program-operation-mechanism}

Last updated: 2021-05-09

Path: miniprogram_gcash

Mini Program Operation Mechanism

2021-05-09 18:43

Download

Mini program does not need installation. When it is used for the first time by the user, AppContainer downloads resources of the Mini Program from the server. The downloaded Mini Program resources are cached in the mobile app client for some time. When the Mini Program with cached resources is opened again, the download process is skipped so the Mini Program is opened faster.

Hot Startup and Cold Startup

- **Cold startup:** When the user opens a Mini Program that has not been started or has been destroyed, this is called a cold startup. Here, the Mini Program starts the initialization process. When the process is completed, it triggers the `onLaunch` callback function.
- **Hot startup:** When the user opens a Mini Program that has been opened but is running in background, this is called the hot startup. Here, the Mini Program is not destroyed and restarted. Instead, it is switched from background to foreground. The `onLaunch` callback function is not triggered.

Foreground/Background Running

- **Foreground running:** When the user opens a Mini Program for the first time, the Mini Program runs in the foreground.
- **Background running:** When the user clicks the close button in the top-right corner to close the Mini Program or press the Home button to leave mobile App, the Mini Program is not destroyed but switched to background.
- **Switching from background to foreground:** When the Mini Program that has not been destroyed by the system is reopened or reactivated, it is switched from background to foreground.

The callback function for foreground/background switching can be registered in `app.js`. When the Mini Program switches from background to foreground, it triggers `onShow`; conversely it triggers `onHide`.

Cache

The local cache system can provide store, get and remove ability to control cache. A Mini Program can store at most 10 MB data. There are two types of API: sync API and async API. The sync API will block current task until the method ends and sync API will not block current task.

Operation	Sync API	Async API	Description
<code>my.setStorageSync</code>	<code>my.setStorage</code>		Store the data according to the key, the original data will be overwrite if the key is the same.
		<code>my.getStorageSync</code>	Get Read cache data.
		<code>my.removeStorageSync</code>	Remove specific data.
		<code>my.clearStorageSync</code>	Clear all the cache data.

Destroy

When the user clicks the close button in the top-right corner to close the Mini Program, the Mini Program is not destroyed but switched to background. Only when the Mini Program stays in background for some time or the system resource consumption is too high, it is really destroyed.

Mini Program Studio

2022-07-03 18:44

The Mini Program Studio is a one-stop development tool that helps you to quickly write, deploy and debug mini programs. With the Integrated Development Environment (IDE), you can build mini programs across all languages. manage the project. In addition, you can use the studio for project management that helps to deal with collaboration across your teams.

Note:

Make sure you have implemented the IDE. If you have not implemented the IDE, choose [RESOURCES](#) in the Mini Program Portal to download.

Features

You can use this studio to do the following:

- Create or open a mini program
- Set up the project with a name and location
- Associate with a mini program to upload code packages
- Customize the compiling mode to pass parameters to the simulator
- Develop and build a mini program
- Manage the structure of mini program
- Develop a mini program
- Debug with a local simulator
- Preview and debug with a real machine
- Upload the mini program

- Check the related information of the current development environment

In addition to the basic functions, you can also benefit from the following functions that are specific to mini programs:

- Realtime preview
- Autocomplete
- Syntax prompt/suggestions

Mini Program general design guidelines

2021-05-10 04:11

User experience is important to deliver services with high quality for merchants in the Mini Program platform. Based on the fast speed and simplicity of the Mini Program and on the principle of fully respecting users' right to know and right to operate, these design guidelines and recommendations are intended to create a friendly, efficient, and

consistent user experience within the wallet ecosystem, while fulfilling a variety of requirements, and achieving a mutually beneficial situation for both users and the Mini Program service providers.

Mini Program types {#mini-program-types}

Last updated: 2022-07-07

Path: miniprogram_gcash

Mini Program types

2022-07-07 17:08

When you create a new mini program, you can choose the mini program type, which can be:

- **DSL (Default):** Native mini program
- **HTML5:** HTML5 mini program

For more information about how to create HTML5 mini programs, see [How to transform an HTML 5 mobile app to an HTML 5 mini program?](#)

Native mini program

Native mini programs call native APIs provided by the wallet app directly. For the functionality introduction about native mini programs, see [Manage Mini Programs](#).

HTML5 mini program

HTML 5 mini programs are embedded with web pages and call native APIs provided by the wallet app through bridges. The overall Mini Program Manage functionalities are the same as that of native mini programs, but have a slight difference between two mini program types. The difference exists in the following aspects:

Category	Difference description
Create the mini program The Entrance URL field is required. Entrance URL is the entrance of the HTML 5 mini program. You can modify the entrance URL after the HTML 5 mini program is created.	The Entrance URL field is required. Entrance URL is the entrance of the HTML 5 mini program. You can modify the entrance URL after the HTML 5 mini program is created.
Develop the mini program The IDE is not required for the HTML 5 mini program development.	The IDE is not required for the HTML 5 mini program development.
Publish the mini program - The publication steps are simpler than that of the native mini program. The package build process is not required.	- The publication steps are simpler than that of the native mini program. The package build process is not required.

- When you submit the publication application, you need to review the mini program information. If all required information is filled in, submit the application. If some required information is missed, fill out the information under **Mini Programs > Info.** || Approve the application | When workspace admins approve the HTML 5 mini program publication application, the step of mini program quality review is not supported. |

Table 1. Difference for HTML 5 mini program

Note:

After you update information, such as client ID, under the Configuration tab, you must save the changes that you made:

- If an unpublished HTML 5 mini program version exists, all changes can be saved for the current unpublished version.
- If no unpublished HTML 5 mini program version exists, all changes can be saved for a new version.

Mini program member roles {#mini-program-member-roles}

Last updated: 2022-07-07

Path: miniprogram_gcash

Mini program member roles

2022-07-07 17:08

This topic provides you with the main duties of mini program member roles and the relations between mini program member roles and workspace member roles.

Overview

Mini program member roles are responsible for managing mini programs from uploading versions to deleting mini programs (all versions). After creating mini programs, mini program members are generated from workspace members. The workspace member who creates a mini program will be set as an admin of the mini program automatically.

Whether for the wallet or merchants, there are two mini program member roles:

- **Admin:** The role can edit mini programs, add mini program members, upload mini programs, set configurations, and release and delete mini programs. A mini program can have multiple admins.

- **Developer:** The role can upload versions from Mini Program Studio to workspaces. A mini program can have multiple developers.

Relations illustration

Mini program member roles are generated from workspace member roles, you can see relations between them in the following figures:

- Wallet

For the wallet, all workspace members can be set as mini program admins or developers. Only workspace admins and workspace developers can create mini programs. After creating a mini program, workspace admins and workspace developers will be set as admins of the mini program automatically. Then admins can invite workspace admins, workspace developers, workspace reviewers, or workspace operators as admins or developers to manage the mini program together.

- Merchant

For merchants, all workspace members can be set as mini program admins or developers. Only developer admins can create mini programs. After creating a mini program, developer admins will be set as admins of the mini program automatically. Then admins can invite developers (workspace) or operators as admins or developers (mini program) to manage the mini program together.

Mini program member authorization

Mini program members of the wallet and merchants only participate in the workflow from add members to delete mini programs. You can see their authorization in the following table:

	Operations	Admin	Developer	Create mini programs	Mini program members generate after creating mini programs. This step is intended for workspace members such as workspace admins, workspace developers, and developer admins to complete.	
	View mini programs	✓	✓	Edit mini programs	✓	✗
	Add mini program members	✓	✗	Upload mini programs	✓	✓
	Configure mini programs	✓	✗	Release mini programs	✓	✗
	Remove mini programs	✓	✗	Delete mini programs	✓	✗

Mini program project configurations {#mini-program-project-configurations}

Last updated: 2022-07-03

Path: miniprogram_gcash

Mini program project configurations

2022-07-03 18:44

With this topic, you can learn to use the `mini.project.json` file in the root directory to configure the mini program project.

Overview

In addition to app and page, the mini program framework also includes project to describe the whole mini program project. For more information, refer to [Framework overview](#).

The project refers to the `mini.project.json` file that must be placed in the root directory of the mini program project. You can use the `mini.project.json` file to configure advanced features, as listed in the table below.

Features

The following table lists the configuration features of the mini program project:

Field Name	Data Type	Description
miniprogramRoot	Path String	Specifies the relative path of the mini program source code (the directory where the <code>app.json</code> file is located).

To enable custom components, check **Enable component2 compile** in the **Details > Project configuration** of the IDE. For more information, refer to [Custom component introduction](#). `component2` Boolean Whether to enable custom components.

To enable axml strict syntax check, check **Enable Strick Axml Check** in the **Details > Project configuration** of the IDE. `axmlStrictCheck` Boolean Whether to enable axml strict syntax check. Once enabled, it can detect the error of unclosed tags and more.

To enable es6 syntax transformation, check **Enable HMR** in the **Details > Project configuration** of the IDE. `enableHMR` Boolean Whether to enable simulator hot update.

To enable es6 syntax transformation, check **Enable NodeModuleBabelTransform** in the **Details > Project configuration** of the IDE. `enableNodeModuleBabelTransform` Boolean Whether to enable es6 syntax transformation.

`exclude` Array[String] The file or file folder to exclude when building package. It follows Glob syntax. For more information, see [exclude package blacklist](#).

exclude package blacklist

When you upload a mini program to Mini Program Platform, the local source codes will be packaged and uploaded to the cloud for building. In addition to the above files, the source code package also includes the following contents:

- Mini program source code files:
 - .acss
 - .axml
 - .js
 - .json
 - .sjs
- Dependency packages in the `node_modules` directory

When uploading, if the source code package is still too large after compression, network timeout may be triggered. To resolve this error, you can add unnecessary files that are built on the cloud to the `exclude` blacklist. For example, if you precompile the code through `src -> dist`, you need to exclude the files in the `src` directory and the `devDependencies` tool in the `node_modules` directory when you upload the mini program.

The following sample code indicates that the source code package excludes the files in the `src` and `node_modules` directories under the root directory of the project:

copy

```
"exclude": [\n  "src/**",\n  "node_modules/**"\n]
```

Mixins

2021-05-09 18:43

The developer may implement multiple custom components which may have common logic to be processed. The Mini Program provides the mixins to meet the requirement.

Sample code:

copy

```
// /mixins/lifecycle.js
export default {
  OnInit(){}
  deriveDataFromProps(nextProps){}
  didMount(){}
  didUpdate(prevProps,prevData){}
  didUnmount(){}
};

copy

// /pages/components/xx/index.js
import lifecycle from '.././mixins/lifecycle';
const initialState = {
  data: {
    y: 2
  },
}
const defaultProps = {
  props: {
    a: 3,
  },
}
const methods = {
  methods: {
    onTapHandler() {},
  },
}
Component({
  mixins: [
    lifecycle,
    initialState,
    defaultProps,
    methods
  ],
  data: {
    x: 1,
  },
});
```

Path: miniprogram_gcash

Modal

2022-07-03 18:44

Dialog box.

Property	Description	Type	Default
className	Custom class.	String	---
show	Show modal or not.	Boolean	false
showClose	Turn off render or not.	Boolean	true
closeType	Close chart type 0: gray icon 1: white icon.	String	0
onModalClick	Callback on clicking footer.	Callback	() => void
onModalClose	Callback on clicking close, not required when showClose is false.	Callback	() => void
topImage	Top image.	String	---
topImageSize	Top image rule, options including lg, md and sm.	String	md
advice	Is operation popup or not.	Boolean	false

Slots

slotName	Description
header	Optional, modal header.
footer	Optional, modal footer.

Example

copy

```
{
  "defaultTitle": "AntUI Component Library",
  "usingComponents": {
    "modal": "mini-antui/es/modal/index"
  }
}
```

copy

```
<view>
  <button onTap="openModal">Show Modal</button>
  <modal
    show="{{modalOpened}}"
    onModalClick="onModalClick"
    onModalClose="onModalClose"
    topImage="https://img.example.com/example.png"
  >
    <view slot="header">Title</view>
    Explain the current status, prompt the user solution, preferably
    no more than two lines
    <view slot="footer">Confirm</view>
  </modal>
</view>
```

copy

```
Page({
  data: {
    modalOpened: false,
  },
  openModal() {
    this.setData({
      modalOpened: true,
    });
  },
  onModalClick() {
    this.setData({
      modalOpened: false,
    });
  },
  onModalClose() {
    this.setData({
      modalOpened: false,
    });
  }
});

Multi Liner {#multi-liner}

Last updated: 2022-07-03

Path: miniprogram_gcash

Multi Liner

2022-07-03 18:44

You can use the multi-liner component to allow users to enter multiple lines of content in an input box.

Note:

The features of the multi-liner component are mainly on the basis of the textarea component. You can see textarea for reference.

Sample code

See the sample codes in different languages:

.json

copy

```
{  
  "defaultTitle": "Multi-liner",  
  "usingComponents": {  
    "multi-liner": "mini-ali-ui/es/multi-liner/index"  
  }  
}
```

.axml

copy

```
<view>  
  <view style="margin-top: 10px;" />  
  <view class="title">multi-liner</view>  
  <multi-liner  
    placeholder="word count"  
    value="{{value}}"  
    onInput="onInput"  
    last="{{true}}"  
    auto-height="{{true}}"  
    controlled="{{controlled}}"/>  
  <view style="margin: 10px;" />  
</view>
```

.js

copy

```

Page({
  data: {
    value: 'content',
    controlled: true,
  },
  onInput(e) {
    this.setData({
      value: e.detail.value,
    });
  },
});

```

Parameters

||||| --- | --- | --- || **Property** | **Type** | **Description** || className | String | Customized class. || inputCls | String | Customized class for the input box that uses the input component. || last | Boolean | An indicator of whether the input box is the last one. The default value is `false`. || value | String | Initial content in the input box. || name | String | Component name, which is used to obtain data by submitting the form. || placeholder | String | Placehoder. || placeholderStyle | String | Style of the placeholder. || placeholderClass | String | Style class of the placeholder. || disabled | Boolean | An indicator of whether to disable the function of clearing the entered content. The default value is `false`. || maxlength | Number | Maximum length of the verification code. The default value is `140`. || focus | Boolean | An indicator of whether to get focus. The default value is `false`. || auto-height | Boolean | An indicator of whether to heighten the input box automatically with the lines increased. The default value is `false`. || show-count | Boolean | An indicator of whether to display the number of the entered words. The default value is `true`. || controlled | Boolean | An indicator of whether the multi-liner component is a controlled component. If the value is `true`, the content in the input box is controlled by `setData`. || onInput | (e: Object) => void | The event that is triggered when users tap the keyboard. || onConfirm | (e: Object) => void | The event that is triggered when users tap the **Done** button on the keyboard. || onFocus | (e: Object) => void | The event that is triggered when an element gets the focus. || onBlur | (e: Object) => void | The event that is triggered when an element loses the focus. |

NPM Package Management {#npm-package-management}

Last updated: 2021-05-09

Path: miniprogram_gcash

NPM Package Management

2021-05-09 18:43

The developer can manage easily all NPM dependencies in the current project within the Mini Program Studio. The entry is shown in the figure below.

Configuration Workspace

Default Workspace

The Mini Program Studio automatically creates default workspace on basis of the path of the package.json file under the current directory. If the package.json is found in the current project, it will show the default workspace as shown above. If the package.json is not found in the root path of the project, it will show an empty workspace. Then you need to click the Add Folder to add the root path manually. Then the Mini Program Studio will create a package.json file in the root path automatically.

Dependency Management

In the npm package management interface, you can manage the dependencies.

- Install specific dependency: input the dependency name in the input box and press enter to install the dependency. There are two options to install dependencies. The npm packages installed in the Dependencies area will go to production and the npm packages installed in the DEV DEPENDENCIES only work for development environment.
- Install all dependencies: click the install all dependencies button to install all dependencies.
- Delete dependency: click the delete button to delete specific dependency.

Obtain basic user information {#obtain-basic-user-information}

Last updated: 2021-05-09

Path: miniprogram_gcash

Obtain basic user information

2021-05-09 18:43

The Mini Program is allowed to obtain basic information of the wallet users. This is an open service which, after a user's authorization, captures basic user information such as avatar, nickname, gender, and region.

Requirements

When obtaining basic user information, mini program developers must meet the following requirements:

- Do not guide users to grant authorization at the launch of the mini program. Users have the right to fully understand the mini program and its operations before giving any authorization.
- Do not obtain the user ID and the user's real name. The information to obtain can only include basic user information, such as user avatar, nickname, gender, and location.
- As the basic user information and the user's mobile phone number are obtained by two JSAPIs, these two kinds of information cannot be requested in the same modal.
- Do not obtain user information that is not related with the business. If the user does not grant authorization on the first request, display the modal to allow the user to reverse the decision when the business requires the authorization again.

Procedures

To obtain the user's basic information in the mini program, mini program developers must complete the following steps:

Step 1: Create a mini program

Apply for an account and create a mini program on the Mini Program platform.

Step 2: Add the feature

In the created mini program, add the feature of obtaining basic user information under the **Features** tab.

Step 3: Call the JSAPI

Call the my.getOpenUserInfo JSAPI to obtain the user's basic information.

Note:

Developers must consider the possibility of users rejecting to grant the mini program authorization to collect their user information. For such cases, developers must have corresponding solutions, such as guiding the user to manually fill in or upload the user information.

Display the authorization modal

In the button component, set the value of *open-type* as `getAuthorize` and set the value of *scope* as `userInfo`.

Sample code:

copy

```
<!-- .axml -->
<button
    open-type="getAuthorize"
    onGetAuthorize="onGetAuthorize"
    onError="onAuthError"
    scope='userInfo'>
</button>
```

Button properties

||| --- | --- || **Name** | **Description** || open-type | The value is getAuthorize. || scope | The value is userInfo. || onGetAuthorize | Authorization success callback. The Mini Program can call my.getOpenUserInfo to get information in this callback. || onError | Authorization failure callback, including user rejection and system exceptions. |

Call the my.getOpenUserInfo JSAPI

After the user grants the authorization, the user basic information can be obtained by calling the [my.getOpenUserInfo](#) JSAPI.

Sample code:

copy

```
// .js
onGetAuthorize(res) {
    my.getOpenUserInfo({
        fail: (res) => {
            },
        success: (res) => {
            let userInfo = JSON.parse(res.response).response
        }
    });
}
```

Sample of a successfully returned message format:

copy

```
{
    "response": {
        "response": {
            "code": "10000",
            "msg": "Success",
            "countryCode": "code",
            "gender": "f",
            "nickName": "XXX",
            "avatar": "https://image_domain/images/partner/XXXXXXXXX",
            "city": "city",
            "province": "province"
        }
    }
}
```

FAQs

Can the function of obtaining basic user information obtain the wallet userId?

No. If mini programs need to obtain the user ID, see [user authorization](#) for details and call [my.getAuthCode](#) to get the user ID.

Can the mini program obtain the user's public information such as mobile phone number, avatar, and nickname at the same time?

Mini programs cannot obtain user's mobile phone number, avatar, nickname at the same time in the same modal.

The following public user information can be obtained with [my.getOpenUserInfo](#):

- Avatar
- Nickname
- Gender
- Country

The following private user information can be obtained with [my.getAuthCode](#):

- User ID
- Phone number

Can mini programs get user ID, real name and private user information through the function of obtaining basic user information?

No. Through the function of obtaining basic user information, mini programs can only get user avatar, nickname, gender, location, and other public information.

Procedures

To obtain the user's basic information in the mini program, mini program developers must complete the following steps:

Step 1: Create a mini program

Apply for an account and create a mini program on the Mini Program Platform.

Step 2: Add the feature

Enter the mini program you just created. Click the " **Features**" tab, then " **Add Feature**" to pop up the feature list. Tick "obtain basic member information" and click the "Confirm" button to activate the feature.

Step 3: Call the JSAPI

Call the my.getOpenUserInfo JSAPI to obtain the user's basic information.

Note:

Developers must consider the possibility that users reject to authorize the mini program to collect their information. In such cases, developers must have corresponding solutions, such as guiding users to manually fill in or upload their information.

Display the authorization modal

In the button component, set the value of `open-type` as `getAuthorize` and set the value of `scope` as `userInfo`.

Sample code:

copy

```
<!-- .axml -->
<button
    open-type="getAuthorize"
    onGetAuthorize="onGetAuthorize"
    onError="onAuthError"
    scope='userInfo'>
</button>
```

Button properties

|||---|---||Name | Description || open-type | The value is `getAuthorize`. || scope | The value is `userInfo`. || onGetAuthorize | Authorization success callback. The mini program can call `my.getOpenUserInfo` to get information in this callback. || onError | Authorization failure callback, including user rejection and system errors. |

Call the `my.getOpenUserInfo` JSAPI

After the user grants the authorization, the mini program can call the `my.getOpenUserInfo` JSAPI to obtain basic user information.

Sample code:

copy

```
// .js
onGetAuthorize(res) {
    my.getOpenUserInfo({
        fail: (res) => {
        },
        success: (res) => {
            let userInfo = JSON.parse(res.response).response
        }
    });
}
```

Sample of a successfully returned message format:

copy

```
{
  "response": {
    "response": {
      "code": "10000",
      "msg": "Success",
```

```

        "countryCode":"code",
        "gender":"f",
        "nickName":"XXX",
        "avatar":"https://image_domain/images/partner/XXXXXXXX",
        "city":"city",
        "province":"province"
    }
}
}
}

```

API list

||||---|---|| **JS API | Description** || [my.getAuthCode](#) | Gets user's authorization code. || [my.getOpenUserInfo](#) | Gets basic user information. |

FAQs

1. Can the function of obtaining basic user information be used to obtain the wallet userId ?

No. If mini programs need to obtain the user ID, see [user authorization](#) for details and call [my.getAuthCode](#) to get the user ID.

2. Can mini programs obtain the user's mobile phone number, avatar, nickname, and other public information at the same time?

No. Mini programs cannot obtain the user's mobile phone number, avatar, nickname at the same time in the same modal.

The following public user information can be obtained with [my.getOpenUserInfo](#):

- Avatar
- Nickname
- Gender
- Country

The following private user information can be obtained with [my.getAuthCode](#):

- User ID
- Phone number

3. Can mini programs get user ID, real name, and private information through the function of obtaining basic user information?

No. Through the function of obtaining basic user information, mini programs can only get user avatar, nickname, gender, location, and other public information.

Overview

2022-07-03 18:44

File Structure

The Mini Program is divided into two layers: app and page. The app describes the whole program; the page describes the individual pages.

The app consists of three files and must be placed in the root directory of the project.

||||| --- | --- | --- || **File** | **Mandatory** | **Function** || app.js | Yes | Mini Program logic. || app.json | Yes | Mini Program global configuration. || app.acss | No | Mini Program global style sheet. |

The page consists of four file types:

||||| --- | --- | --- || **File type** | **Mandatory** | **Function** || js | Yes | Page logic. || axml | Yes | Page structure. || acss | No | Page style sheet. || json | No | Page configuration. |

Note: For the convenience of developers, we specify these four files must have the same path and filename. All the codes written by the developer will eventually be packaged into a JavaScript script which runs when Mini Program start and is destroyed when Mini Program finish running.

Logic Structure

The core of Mini Program is a responsive data binding system, composed of the view layer and logic layer. The two layers keep always synchronous. Whenever the data is modified in logic layer, the view layer is updated accordingly.

See the following simple example.

copy

```
<!-- View layer -->
<view> Hello {{name}}! </view>
<button onTap="changeName"> Click me! </button>
```

copy

```
// Logic layer
var initData = {
```

```

    name: 'AppContainer'
};

// Register a Page.
Page({
  data: initialData,
  changeName(e) {
    // sent data change to view
    this.setData({
      name: 'Mini Program'
    })
  }
});

```

In the above codes, the framework automatically binds the name in the logic layer to the name in the view layer, so whenever the page is opened, it displays Hello AppContainer!

When the user presses the button, the view layer sends the `changeName` event to the logic layer. The logic layer finds the corresponding event handler. The logic layer executes the `setData` operation, changing the name from `AppContainer` to `Mini Program`. Since the logic layer and view layer are already bound, the displaying of the view layer automatically changes to Hello Mini Program!.

Note: Since the framework does not work in the browser, some web capabilities of JavaScript cannot be used, such as the `document` and `window` objects.

For the logic layer js, the codes can be organized through the es2015 modular syntax:

copy

```

import util from './util'; // Loading relative path
import absolute from '/absolute'; // Loading project root directory
path

```

Reserved Names for Module
